

Use of IASI Radiances climatology in climate studies

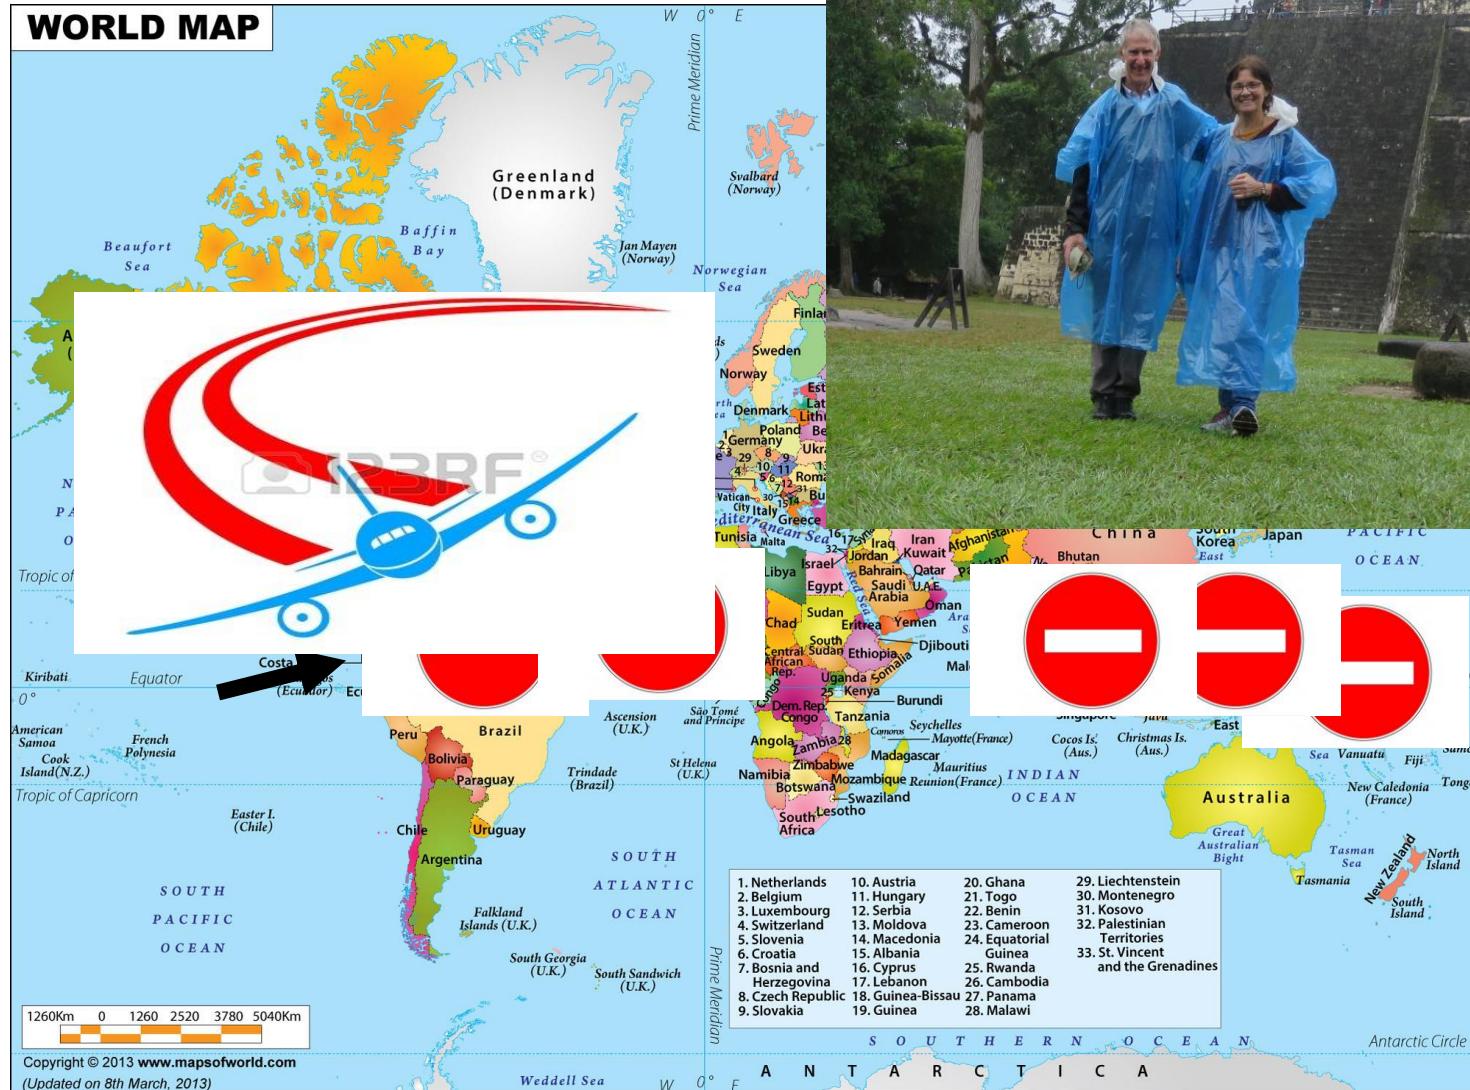

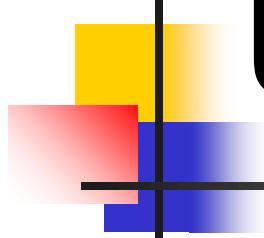

Thierry Phulpin, retired

with contributions from C. Bellisario, J. Gonzalez and S. Gaugain

And help by Manuel Grizonnet for HadISST

Who are the users of a climatology? For which purpose?

Users of climatology

Climate expert scientists

To describe the most accurate state of atmosphere and environment in the past

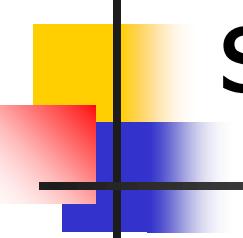

- Used to control ability of climate models to reproduce climate variations
- To initialize climate models from monthly, to seasonal and climate long term projections
- To attribute change to forcing factors
- For statistics
- For Climate service development

Others: Space agencies (e.g. for mission simulation), Public, Media etc.

Rationale of IASI radiance climatology

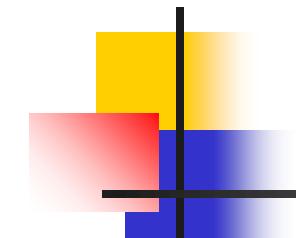

- Demonstrate pertinence of IASI radiance climatology
 - To validate reanalyses
 - To analyze and understand climate events.
 - To Attribute
- Advantages
 - Accuracy and stability (Calibration)
 - Length of program with consistent products (>40 years)

- Radiance Spectra contain consistent information on many ECVs
- Not biased by models like inverse products

Why using IASI for Climate studies ?

- Very stable
 - Very well calibrated → a reference for re-calibration of infrared sensors
- (WMO's GSICS)
- 15 years of data and more with the continuation with IASI-NG
 - Very large information content on atmospheric ECVs
 - IASI is well sized to deliver FCDR and TCDR for Climate monitoring.
 - It is also used in study of processes.

IASI radiance global climatology

- Already 10 years of IASI-A data
- Representing 2M/s, 170Go/d, 63 To/y
- Monthly statistics on line => avoid huge processing and keeps useful data
- Why radiances?

- Which scale ?

Global scale (like altimetry). Global change tb
perceived at
Regions (ENSO34 and Pac W, latitude belts)

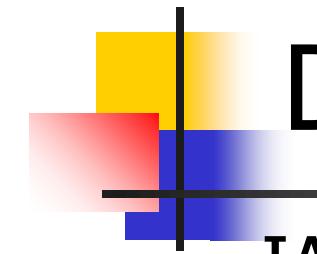

L1c > less frequent reprocessing
Explore the wealth of spectral content vs
selected channels
Promising previous work (Harries (2003), T.
Slingo, ..) etc.

- Which time period?

Monthly values. Seasonal if pertinent.
Year to year variation

- Which various conditions?

All, Land/sea, day/night,
cloudfree (CF=0), Overcast

Data used in this climatology

- IASI – A Level 1C spectra archived at Ether center
- Period of time : March 10 to December 12
June 10 to last month
- Includes AVHRR cloud fraction in IASI pixels

| | |
|-------------------------------|-----------------------|
| Cloud mask count | 1,36E+07 |
| Average cloud mask | 69,2419 |
| Clear pixels count | 1,49E+06 89,06 |
| Cloudy (>=95%) pixels count | 7,25E+06 |
| Pixels count | 1,36E+07 |
| Cloud mask standard deviation | 39,5504 |

Huge number of pixels (night only!)

Mean cloud fraction ≠ ratio of **cloud contaminated pixels**

| Ch. | mean | rad | Clear mean | Cloud mean | All rms | Clear rms | Cloud rms | all sk. | Clear sk. | Cloud sk. | Kurt. | Clear kurt. | Cloud kurt. | all_Tb | clear_Tb | cloud_Tb |

skewness

kurtosis

Global statistics or regional

Validity of this climatology

- Very large data set
- Homogeneity of spectral sampling

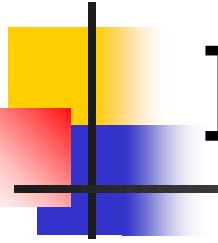

Correct sampling (even if weight of poles slightly minored)

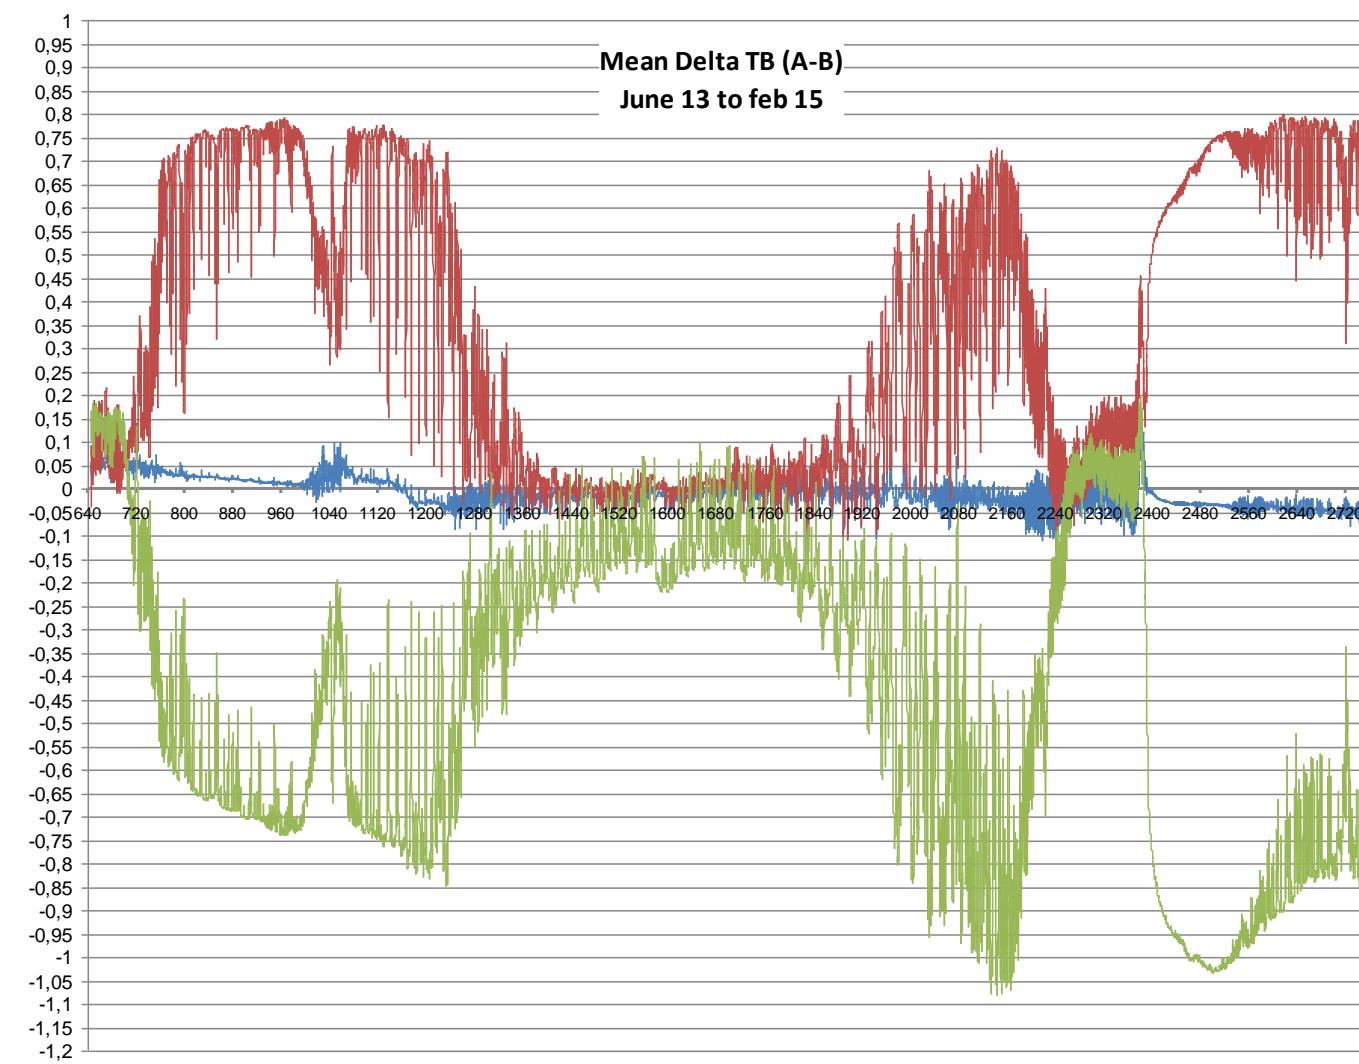

Caution: gaps due to instrument monitoring : external calibration, etc.)

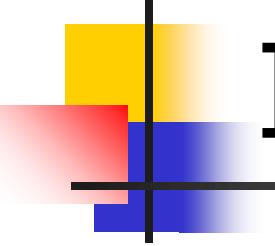

- But

Quality of climatology of clear pixels depends on cloud fraction accuracy => Cloud free test must remain stable

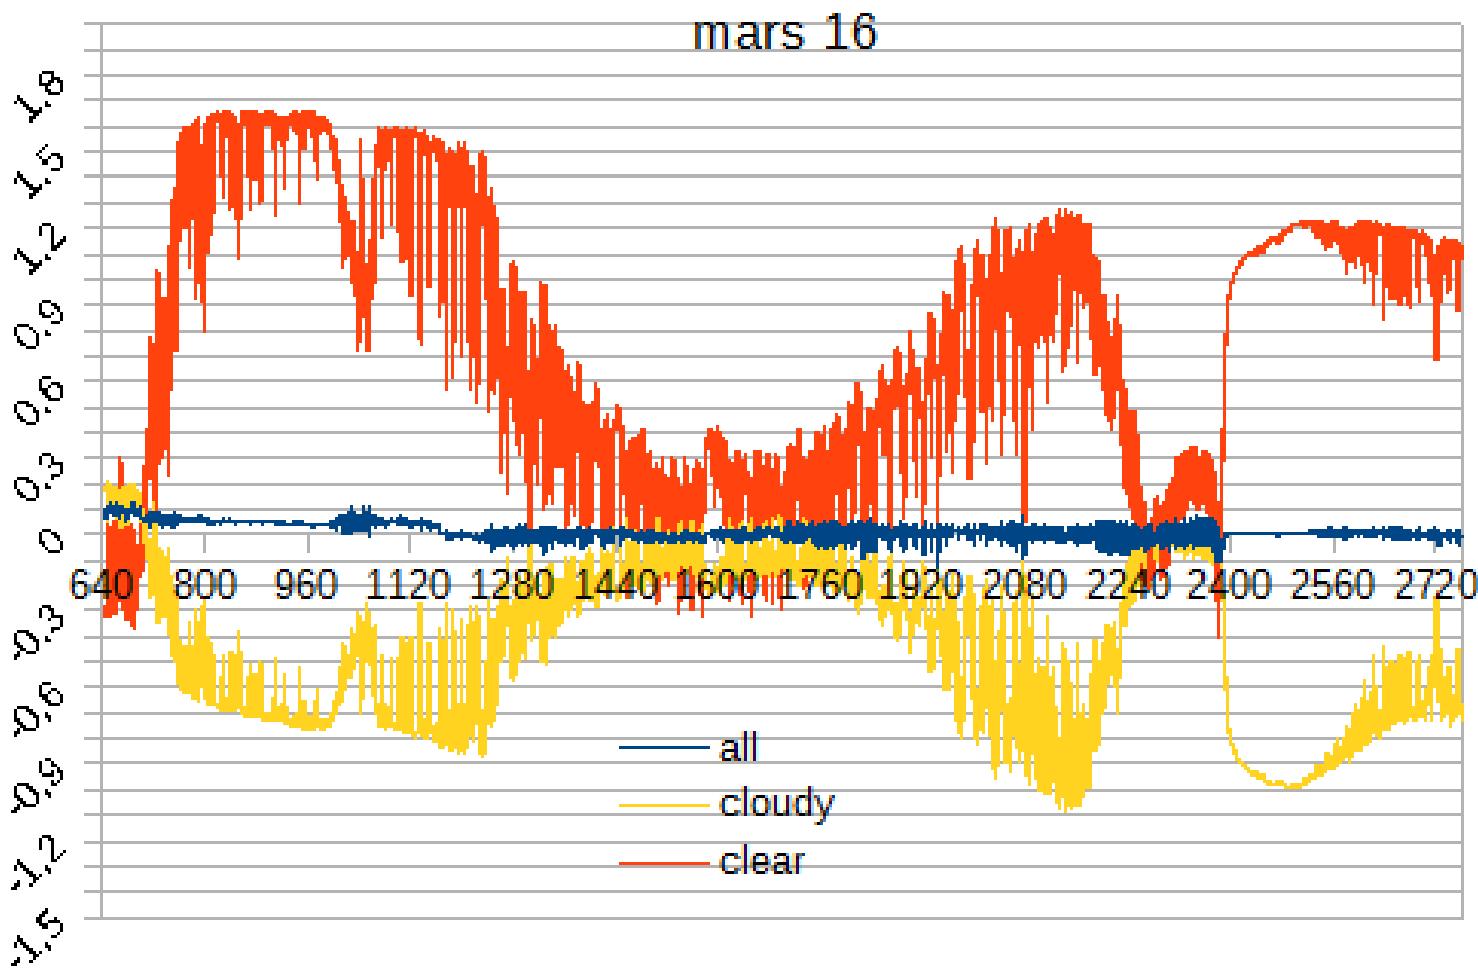

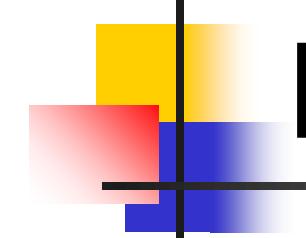

IASI-A vs IASI-B

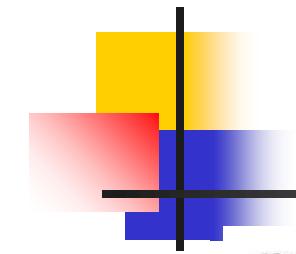

IASI-A vs IASI-B

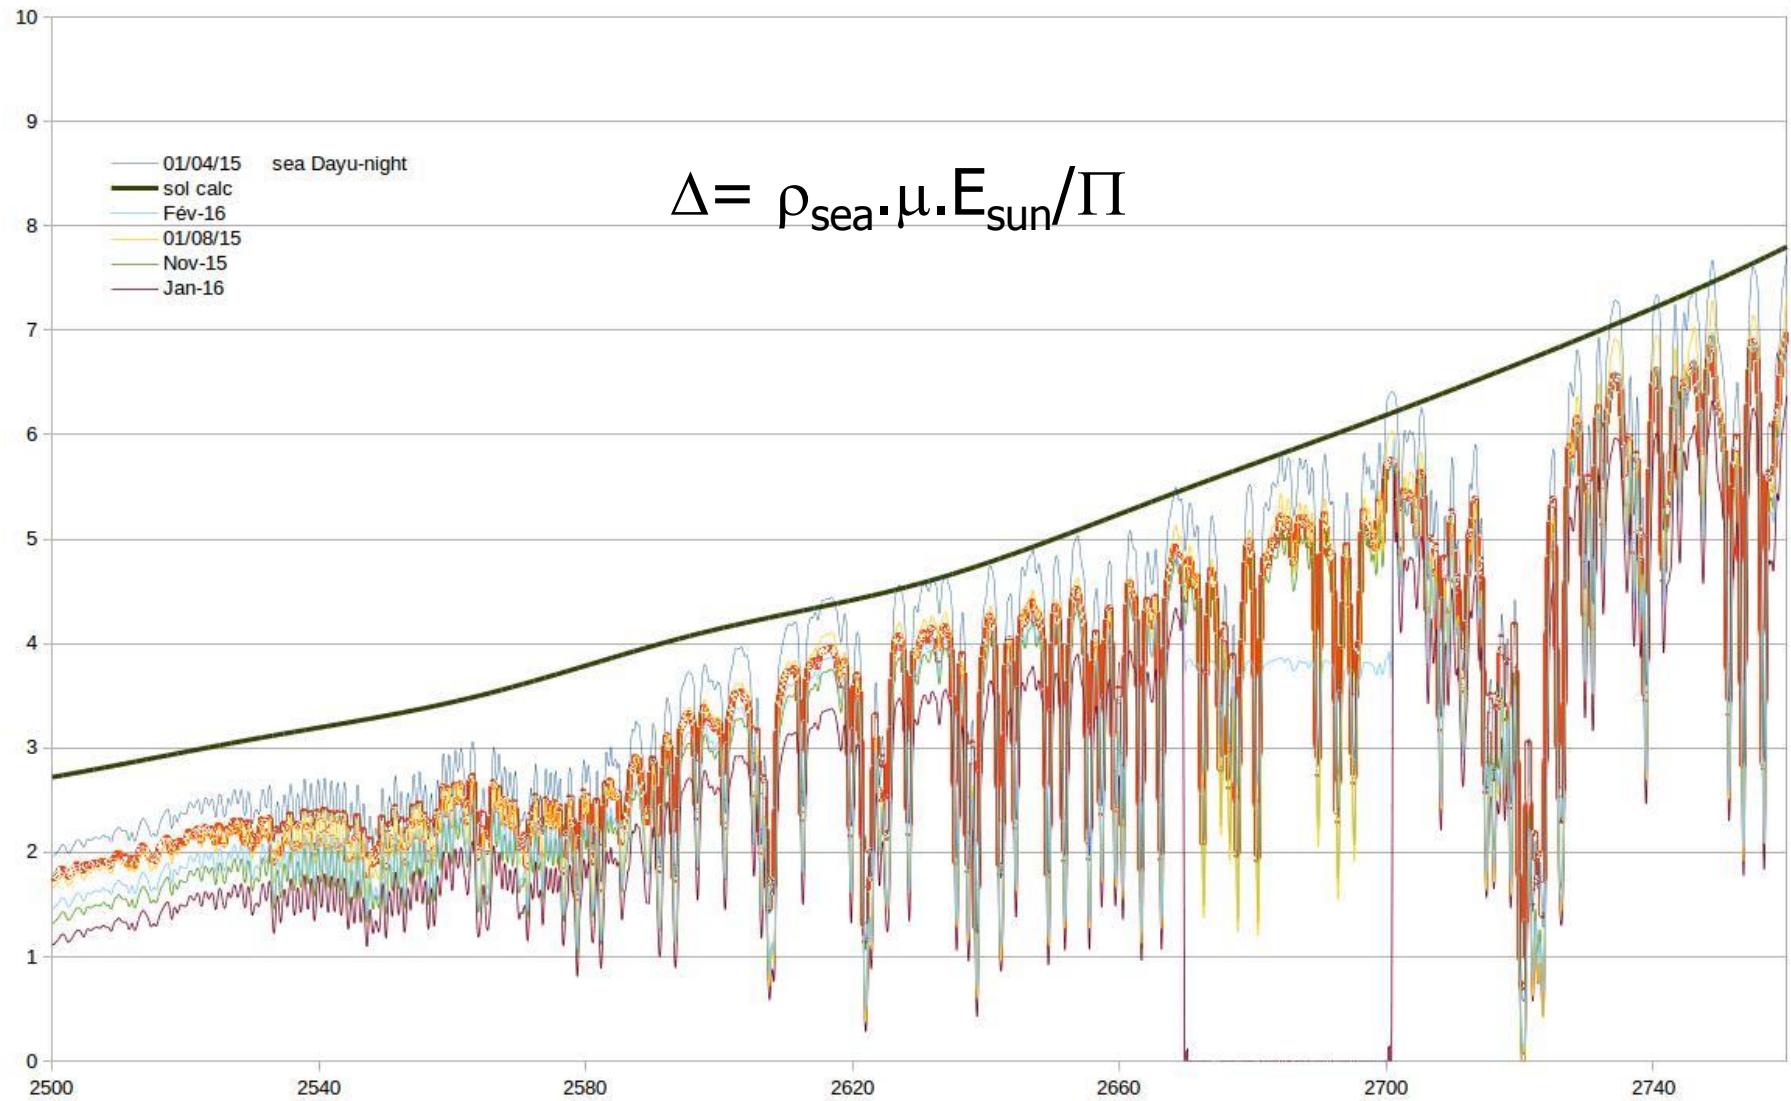

Recent Improvements

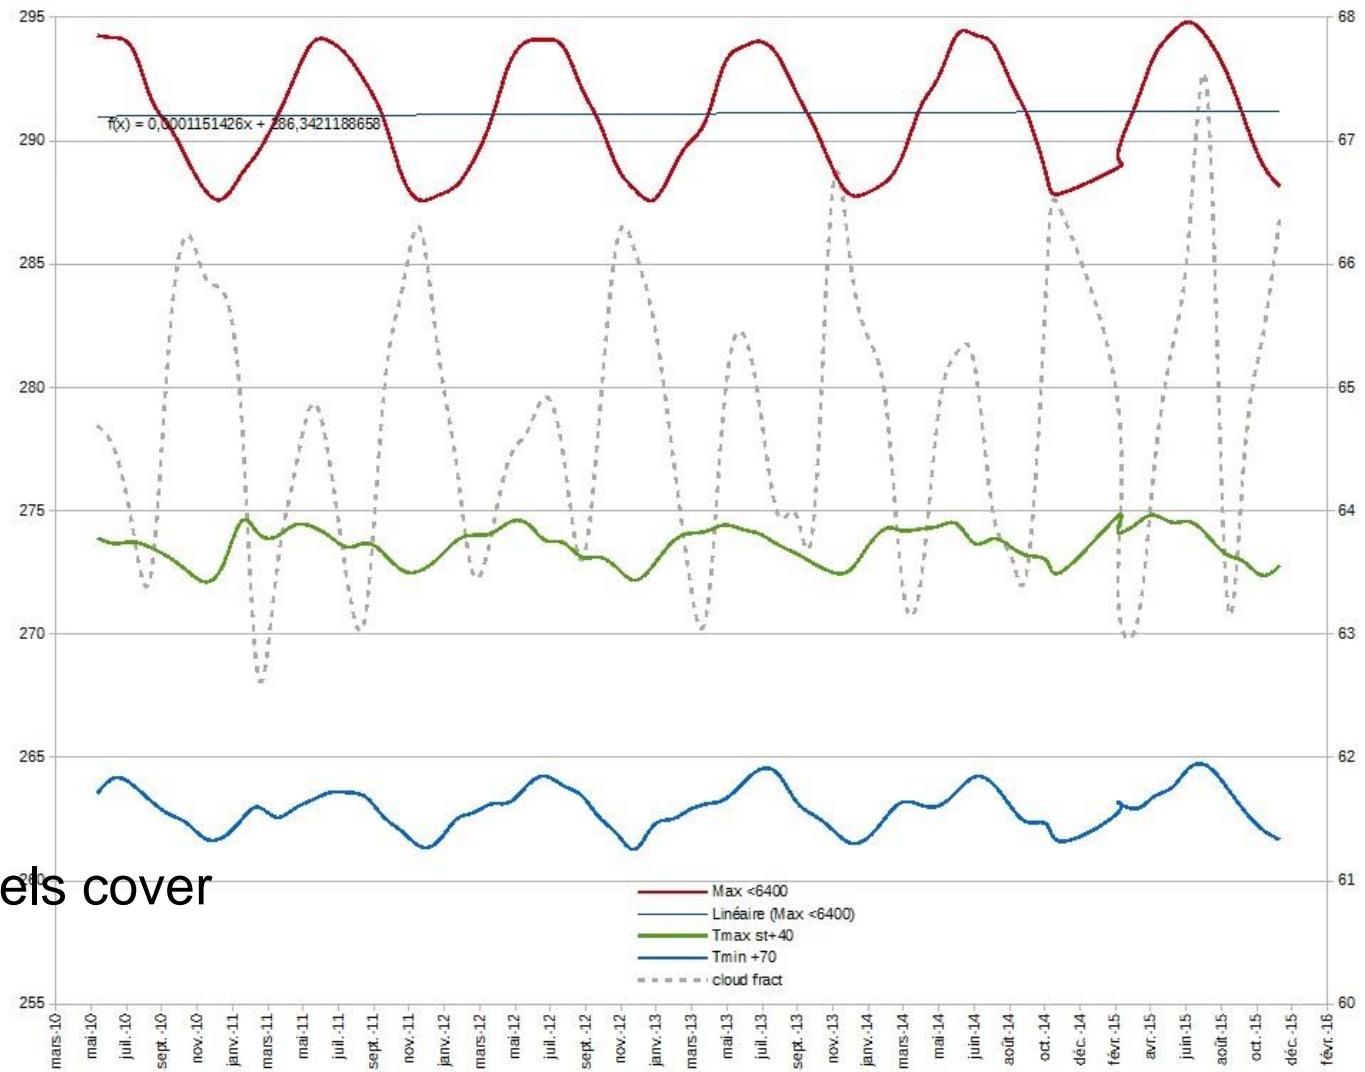

- Statistics with low viewing angle ($<17^\circ$)
(near nadir)
- Calculation of solar contribution
- Comparison with HadISST

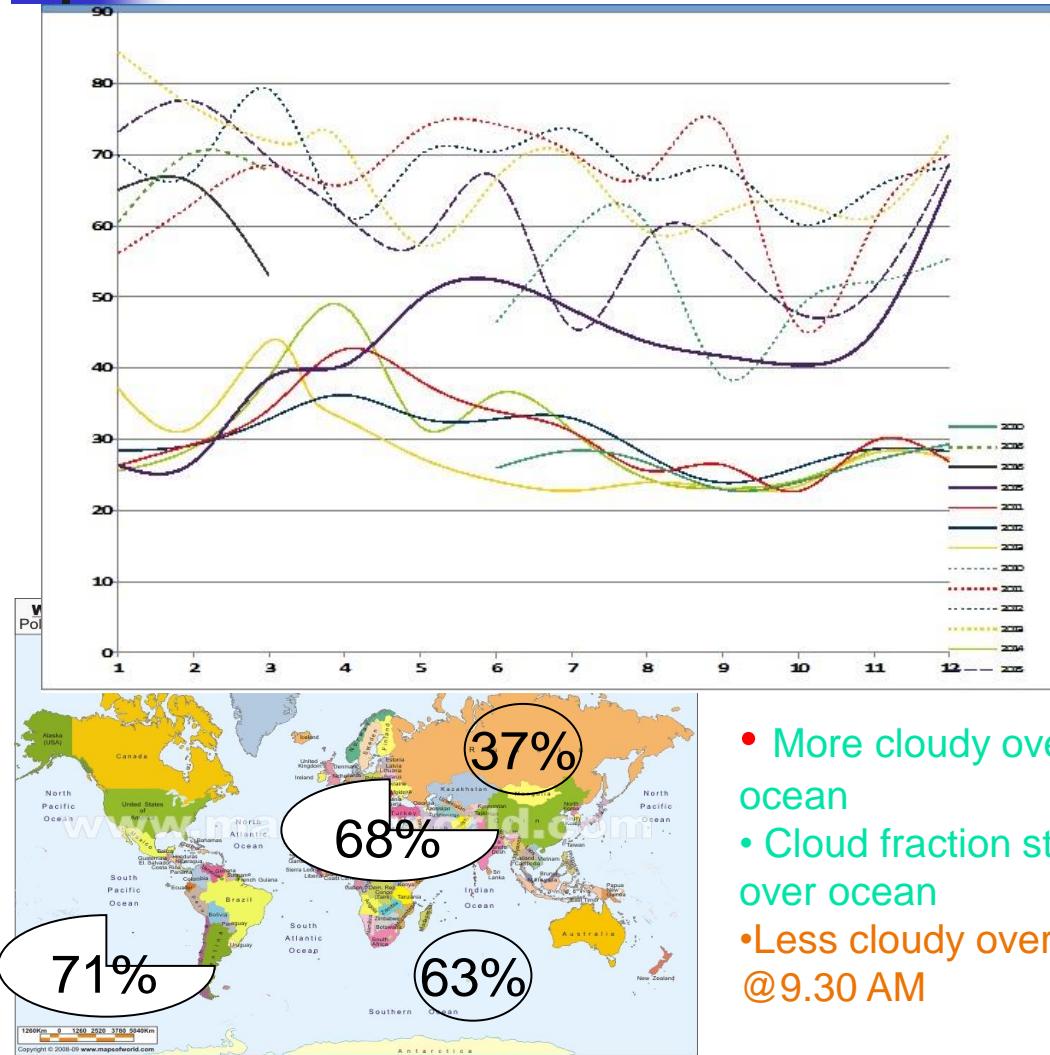

Sun reflectance contribution

Climate Indicators

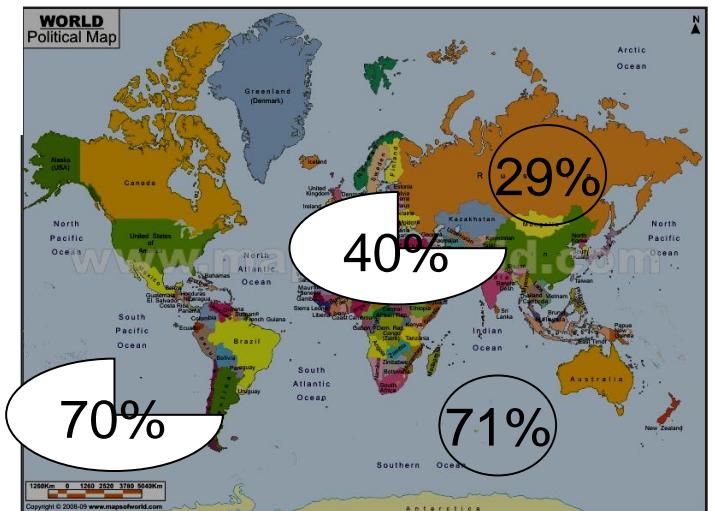

Cloudiness

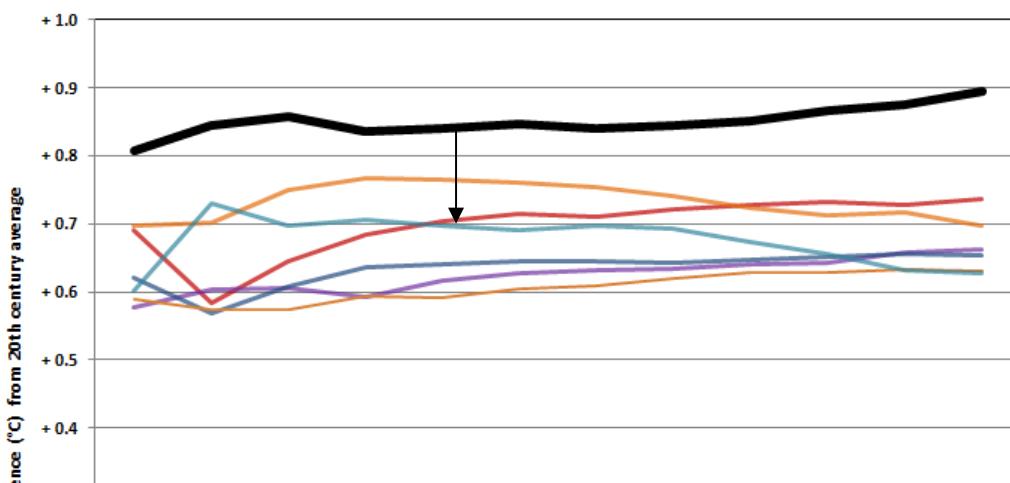

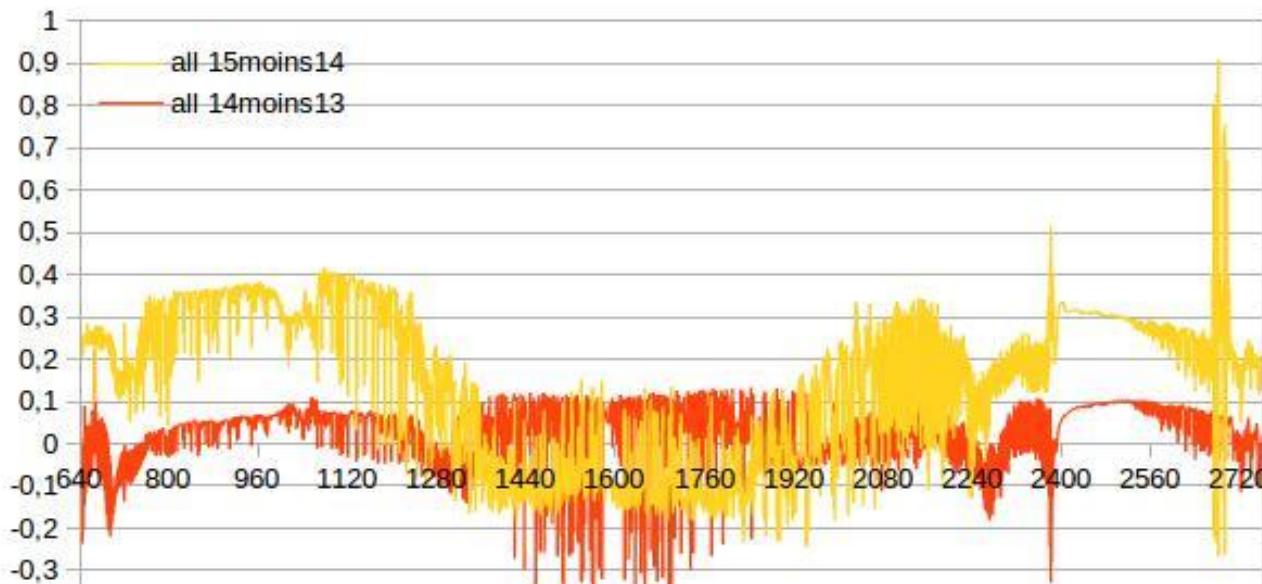

- More cloudy over ocean
- Cloud fraction stable over ocean
- Less cloudy over land @ 9.30 AM

**VERY STABLE
CONSISTENT WITH Gewex
Cloud assessment**

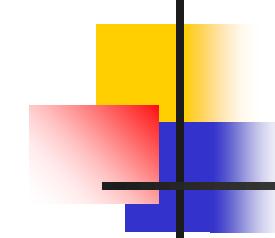

Year to year variations

0,15K

| | 2014 | 2015 |
|---------|-----------|--------|
| H2O | 1,20% | 2,00% |
| O3 | -0,20% | -0,20% |

IASI SST 20S-20N

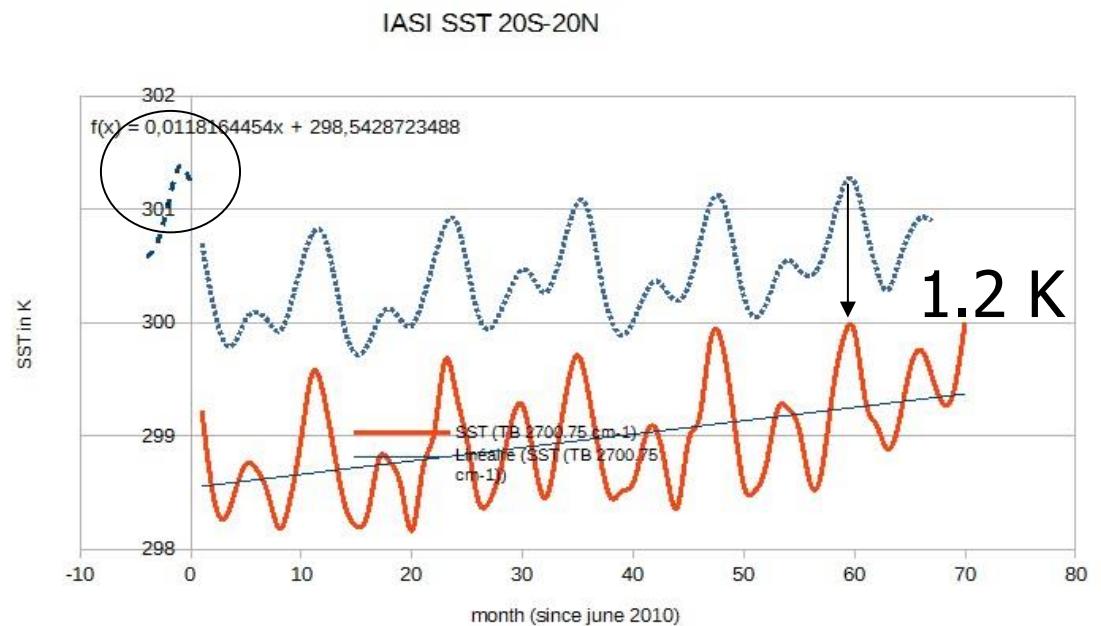

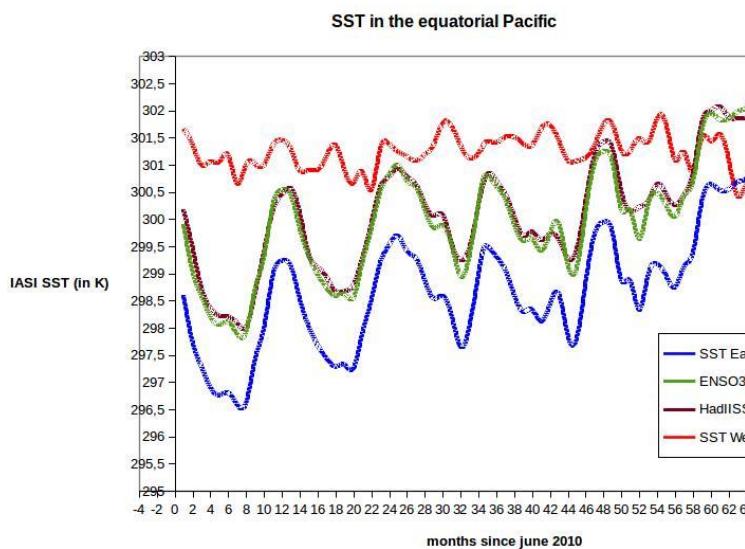

Global

Comparison with HadISST (1)

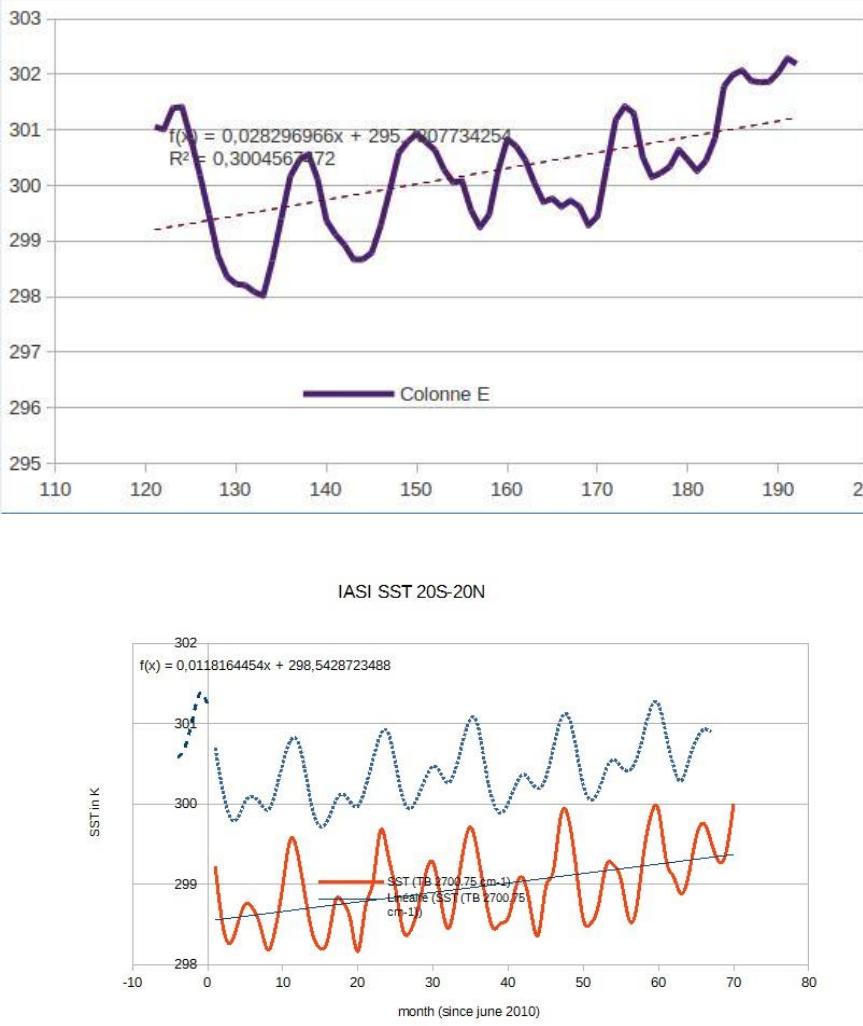

ENSO areas : 34 and PW

Bias around 1.2K

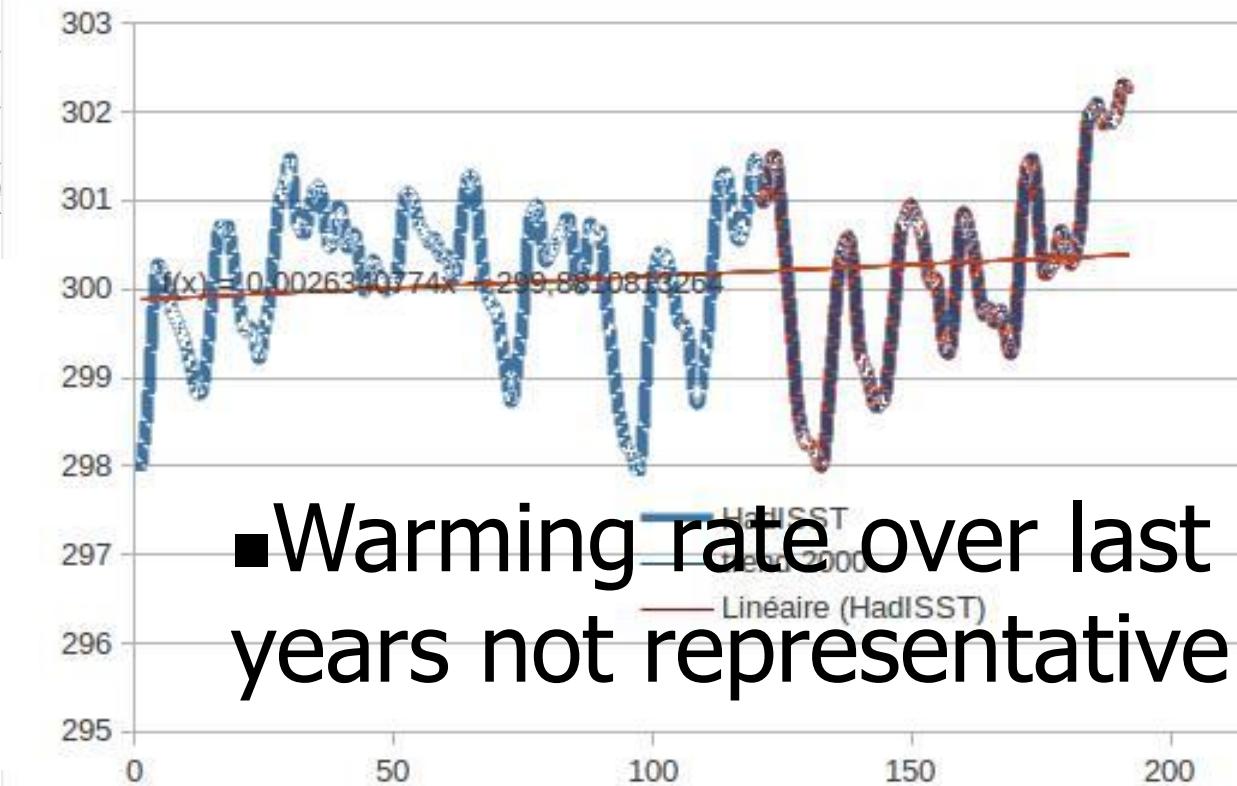

Residual bias = 0.2-0.4K

Sea surface emissivity (0.978) = 0.6K
 Skin effect = 0.1-0.2K
 Atmospheric absorption = 0.1-0.2

Comparison with HadISST (2)

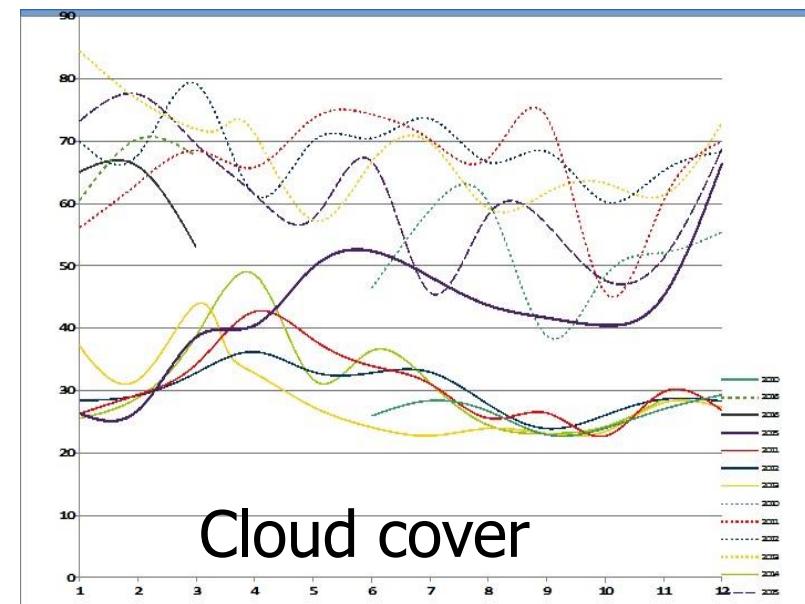

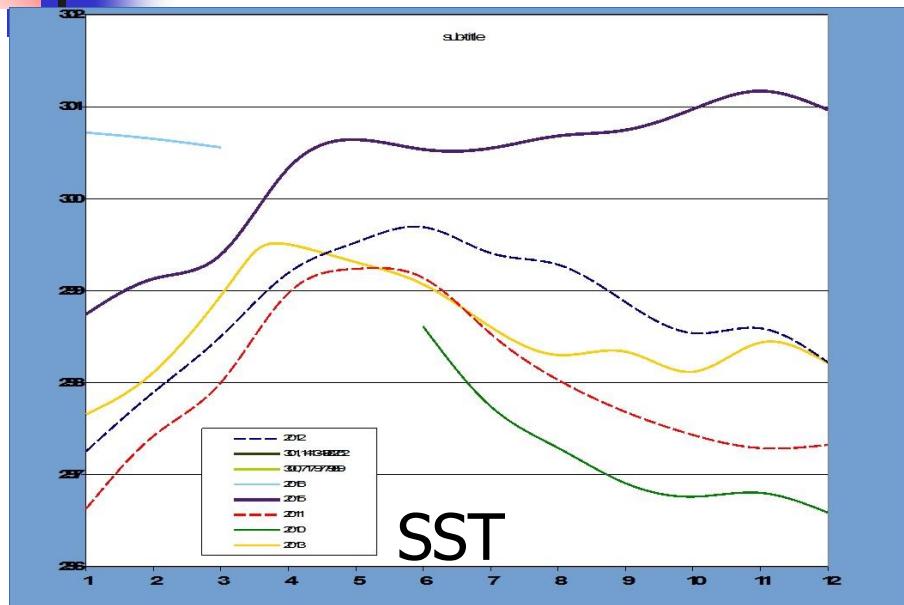

Tilt :0.3K/year over
ENSO34
>0.1K/year over Tropics

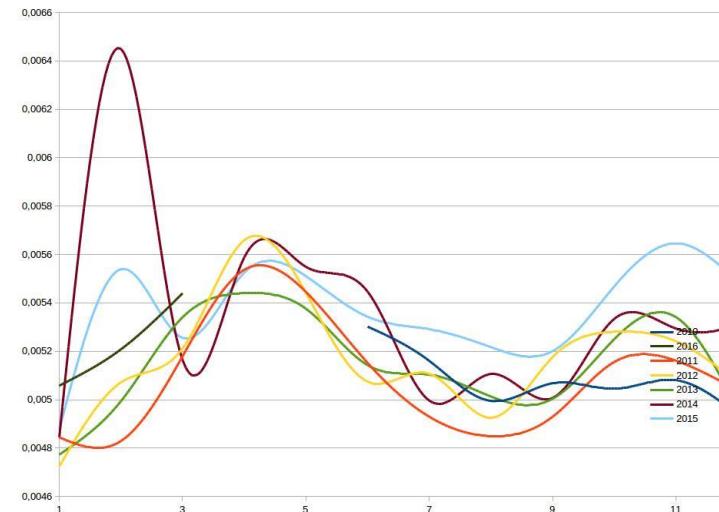

■ Warming rate over last
years not representative

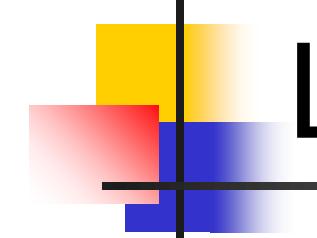

ENSO events

HDO
Tropical ocean

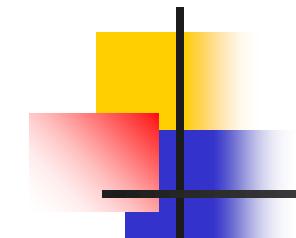

Cloud cover:
consequence of
warm waters?
High humidity
before start of
ENSO?

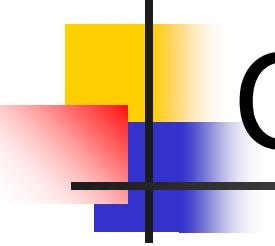

Lessons from comparison

- HadISST : slight warm bias –around 0.3K
- Increasing rate of SST must be relativised with extension with a larger period.
- IASI used to study ENSO events with various parameters

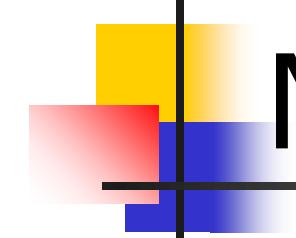

Conclusions

- IASI Level 1C spectra climatology such performed is very rich in information
 - Very simple to implement
 - Allows consistent access to various ECVs
 - And a qualitative evaluation
 - Very simple to inverse
- It brings a new tool for climate analysis
 - Allows with a same tool to get several variables all over the globe
 - Consistency between variables
 - Consistent observations in different regions to analyze potential teleconnections

Conclusions

- Thanks to the high quality of IASI data and processing, Infrared radiance spectra are to be included among Climate variables to produce and archive on the long time.

Next steps

- Simulate mean IASI spectra month by month with ERA Interim reanalysis and confront.
 - Study the sun reflection term to check any change in forcing
 - Make the data available to the community

Reprocessed IASI L1c products for 2007 – mid 2010 URGENT !!!!

THANK YOU FOR ALL!

Most recent statistics : 2016!!!
