

Worldwide spatial and temporal ammonia (NH_3) variability revealed by IASI

M. Van Damme

L. Clarisse, S. Whitburn, C. Clerbaux, P.-F. Coheur

« Planetary boundaries »

=“safe operating space for global societal development with respect to the Earth system and are associated with the planet's biophysical subsystems or processes”

N cycle is one of the main Earth-system processes for which the control variable has been exceeded

Earth-system process	Control variable	Planetary boundary (zone of uncertainty)	Current value of control variable
Biogeochemical flow: N cycle	Industrial and intentional biological fixation of N	62 Tg N yr ⁻¹ (62–82 Tg N yr ⁻¹)	~150 Tg N yr ⁻¹

PM formation

La pollution à Paris aussi nocive que le tabagisme passif

LE MONDE | 24.11.2014 à 10h18 • Mis à jour le 25.11.2014 à 12h09 |
Par Sophie Landrin et Laetitia Van Eeckhout

China's largest algal bloom turns the Yellow Sea green

The algae, which can suffocate marine life, is thought to be caused by pollution from agriculture and industry

Karl Mathiesen

Les algues vertes gagnent les côtes de Normandie

Alerte : les algues vertes qui prolifèrent dans le surplus d'azote gagnent nos côtes. Dans le Calvados, à Grandcamp-Maisy, près de 1 000 tonnes d'algues ont déjà été relevées.

Mise à jour : 10/07/2014 à 12:33 par La Rédaction

(European Nitrogen Assessment, 2011)

Haber-Bosch process (1908):

Inefficient use of Nr created:

80% of N consumed is lost!

> 2 x Nr introduction in the environment in comparison with before the industrial revolution

WATER BODIES

AIR QUALITY

Numerous environmental impacts

CLIMATE CHANGE

TERRESTRIAL ECOSYSTEMS

Nitrogen Cascade

(Galloway et al., 2003)

NH₃ in the atmosphere

65.4 Tg N released in 2008 (Sutton *et al.*, 2013) → dominates global emission of total reactive nitrogen

Sources:

- Uncertainties > ± 30%
- Large variations at national/regional scale

Sinks:

- PM formation

European Nitrogen Assessment, 2011:

Limited availability of NH₃ observations is currently a barrier for effective monitoring of the nitrogen cycle

→ GLOBAL NH₃ MEASUREMENTS FROM IASI

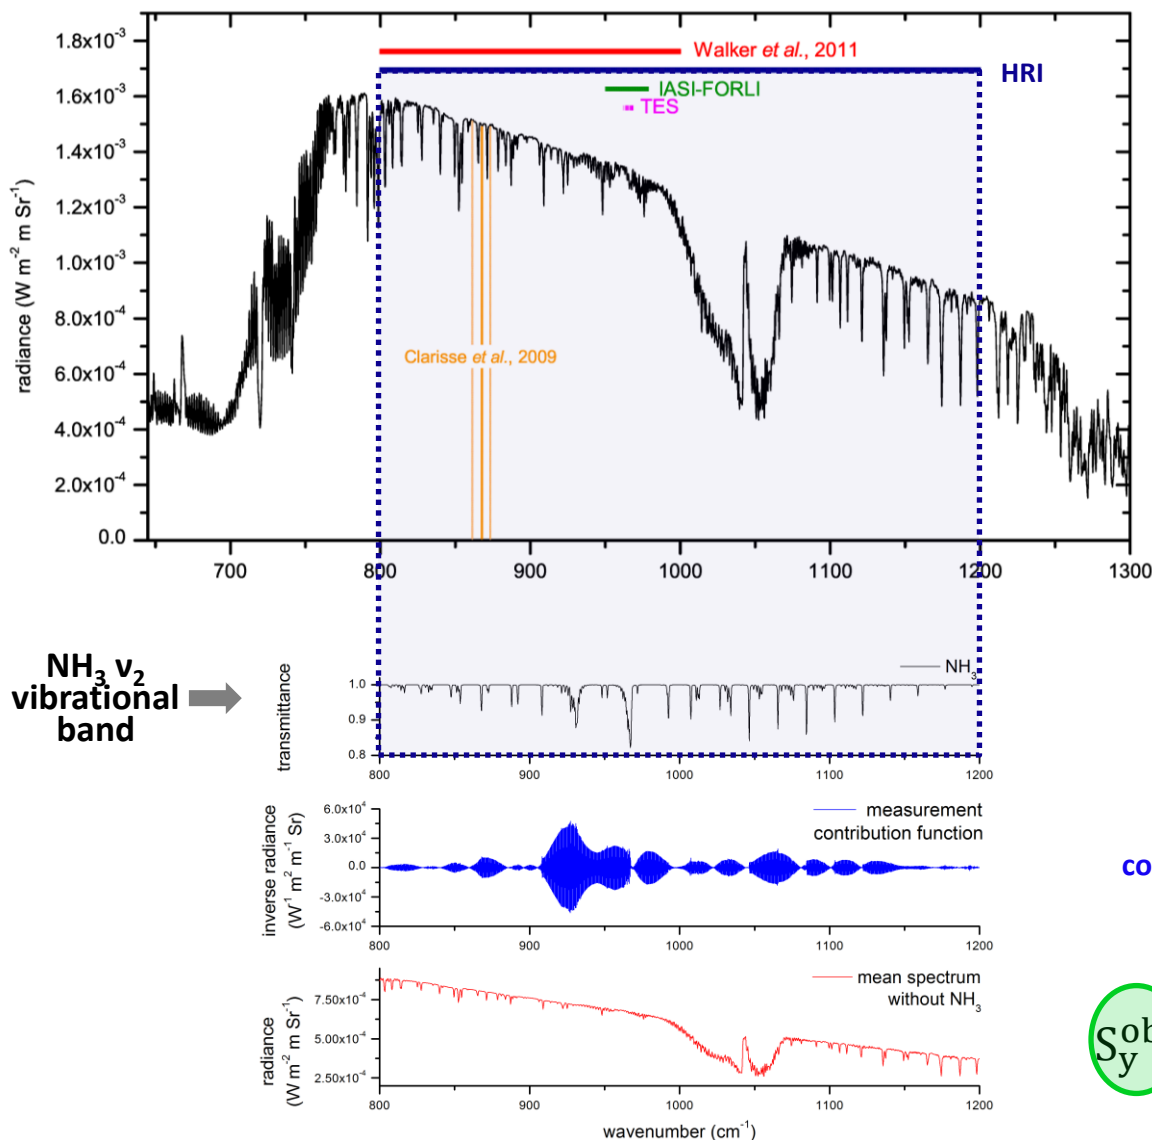

1. Development of a retrieval algorithm for NH₃
2. Geophysical analyses of NH₃ distributions and time-series

- CIVIS: Chemical Ionization Mass Spectrometer
- DOAS: Differential Optical Absorption Spectroscopy

- Limited by the lack of reliable inventories/ observations

Method (1) Calculation of the Hyperspectral Range Index (HRI)

(Van Damme et al., ACP 2014)

quantity representative of the NH₃ abundance

y measured spectrum

$$\text{HRI} = G(y - \bar{y})$$

Jacobian

$$G = (K^T S_y^{\text{obs}} K)^{-1} K^T S_y^{\text{obs}}^{-1}$$

measurement contribution function

variance/covariance matrix of the spectral ensemble

$$S_y^{\text{obs}} = \frac{1}{N-1} \sum_{j=1}^N (y_j - \bar{y})(y_j - \bar{y})^T$$

average of the spectral ensemble (N y_j IASI spectra without NH₃)

Method (2) From HRI to NH_3 column

15/08/2010

IASI
L1C

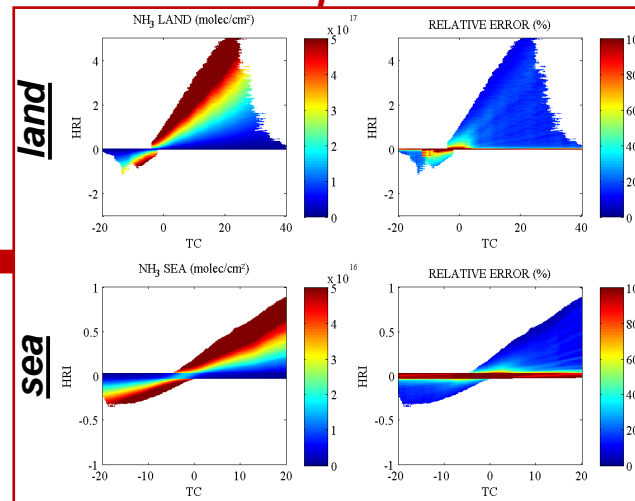

IASI
L2

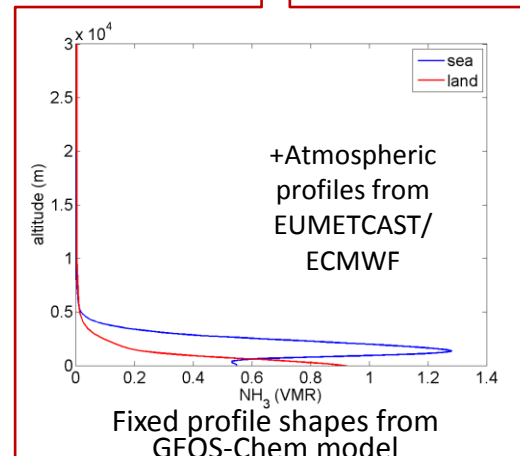

+

- Near-real time processing
- Low computational resources
- Increased sensitivity
- Error characterization

Look-Up-Tables

Line-by-line RTM

(Van Damme *et al.*, ACP 2014)

NH_3 (molec/cm²)

RELATIVE ERROR (%)

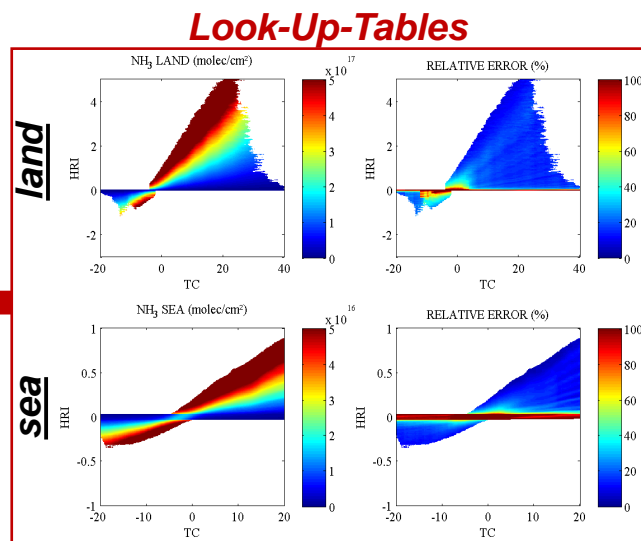

-

- Only clear-sky scene processed
- Uncertainties depend on the amount of NH_3 and the thermal contrast
- Fixed profile shapes

Method (2) From HRI to NH₃ column

15/08/2010

IASI
L1C

**Artificial
Neural Network!**

$$\text{NH}_3 \text{ column} = \text{HRI} \times f(T, T_{\text{surf}}, P, \text{H}_2\text{O}, \sigma, z_0, \epsilon, \text{angle}) \quad (\text{Whitburn } et \text{ al.}, \text{ accepted in JGR-atm})$$

Advantages:

- ✓ Full atmospheric state is taken into account as there is no limit on the number of input parameters
- ✓ Full uncertainty analysis is achieved by perturbing the input parameters
- ✓ Reduced bias, NN approach allowing negative columns
- ✓ Flexible NH₃ profiles

“An evaluation of IASI- NH_3 with ground-based FTIR measurements”
(Dammers *et al.*, ACPD 2016)

Very good correlation obtained with airborne data set

(Van Damme *et al.*, AMT 2015)

Global distributions

5-yr mean distributions (Nov-2007 → Oct-2012)
Mean columns associated with a relative error > 75%/58%
(land/sea) have been filtered out

6-yr composite seasonal distributions over land (2008 → 2013)
Mean columns associated with a relative error > 75%
have been filtered out

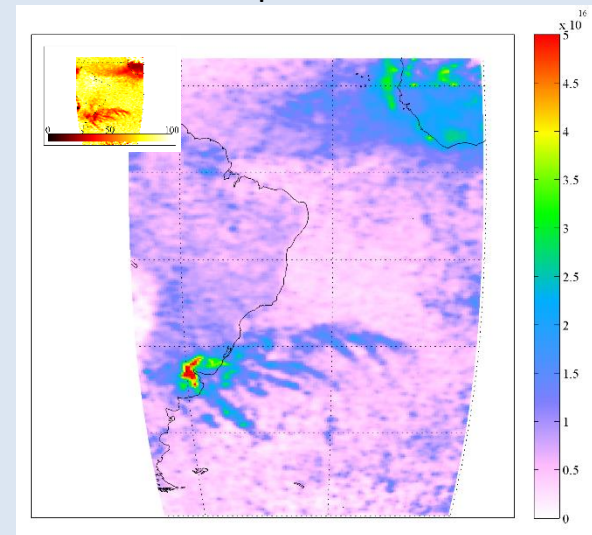

Transport over Atlantic Ocean

12 to 18 September 2011

April 2008

SON

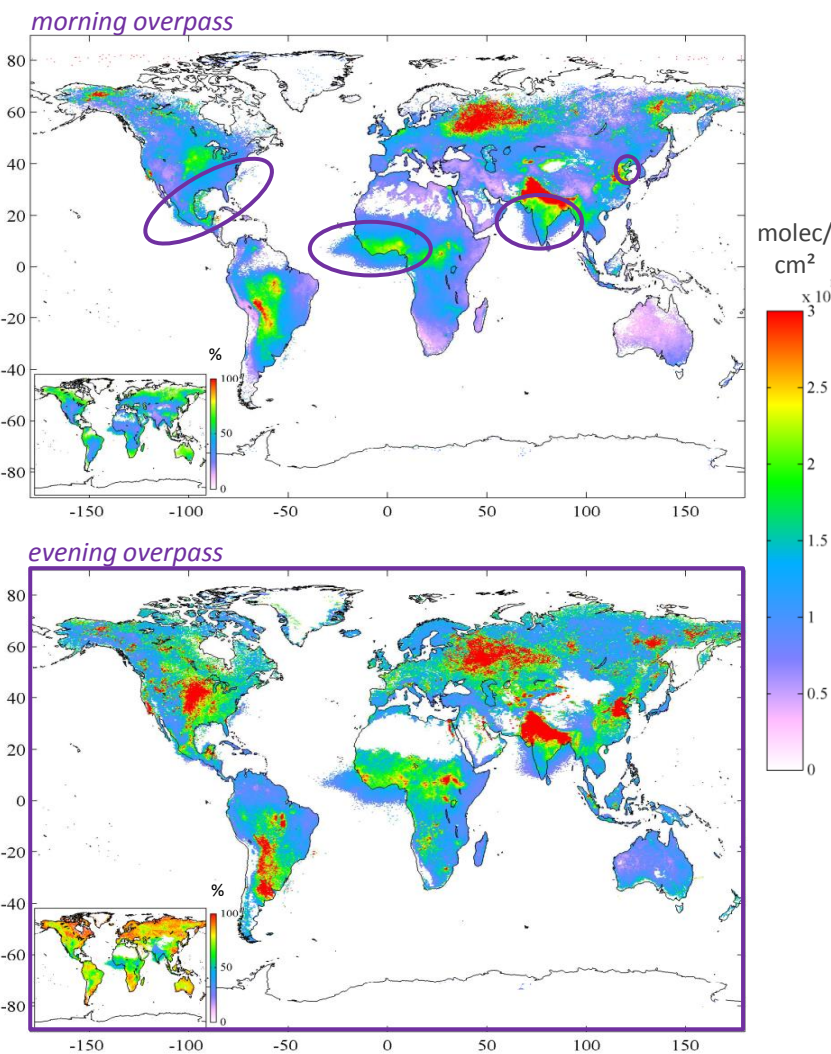

(Van Damme *et al.*, ACP 2014)

(Van Damme *et al.*, GRL 2015)

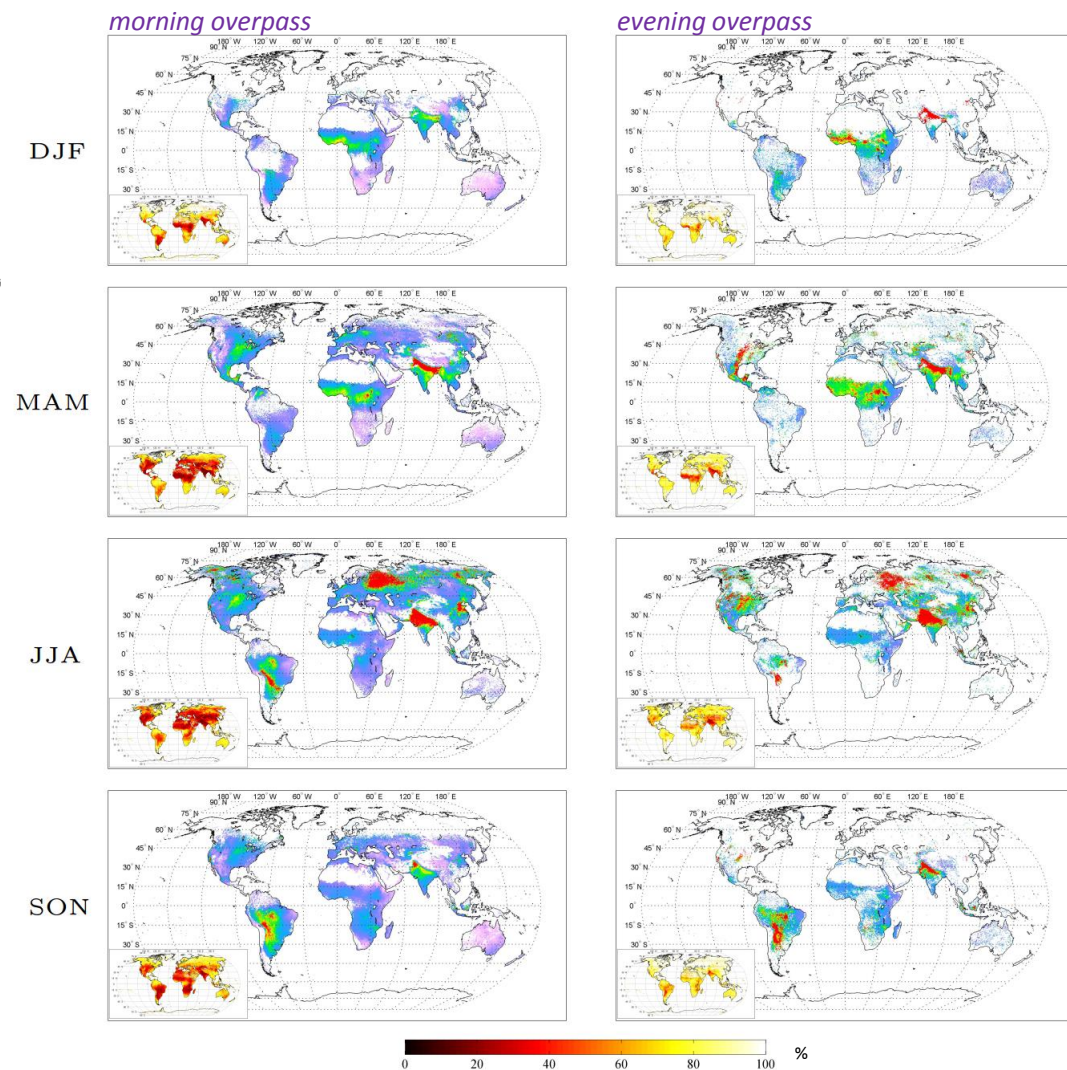

Global distributions

5-yr mean distributions (Nov-2007 → Oct-2012)
Mean columns associated with a relative error > 75%/58%
(land/sea) have been filtered out

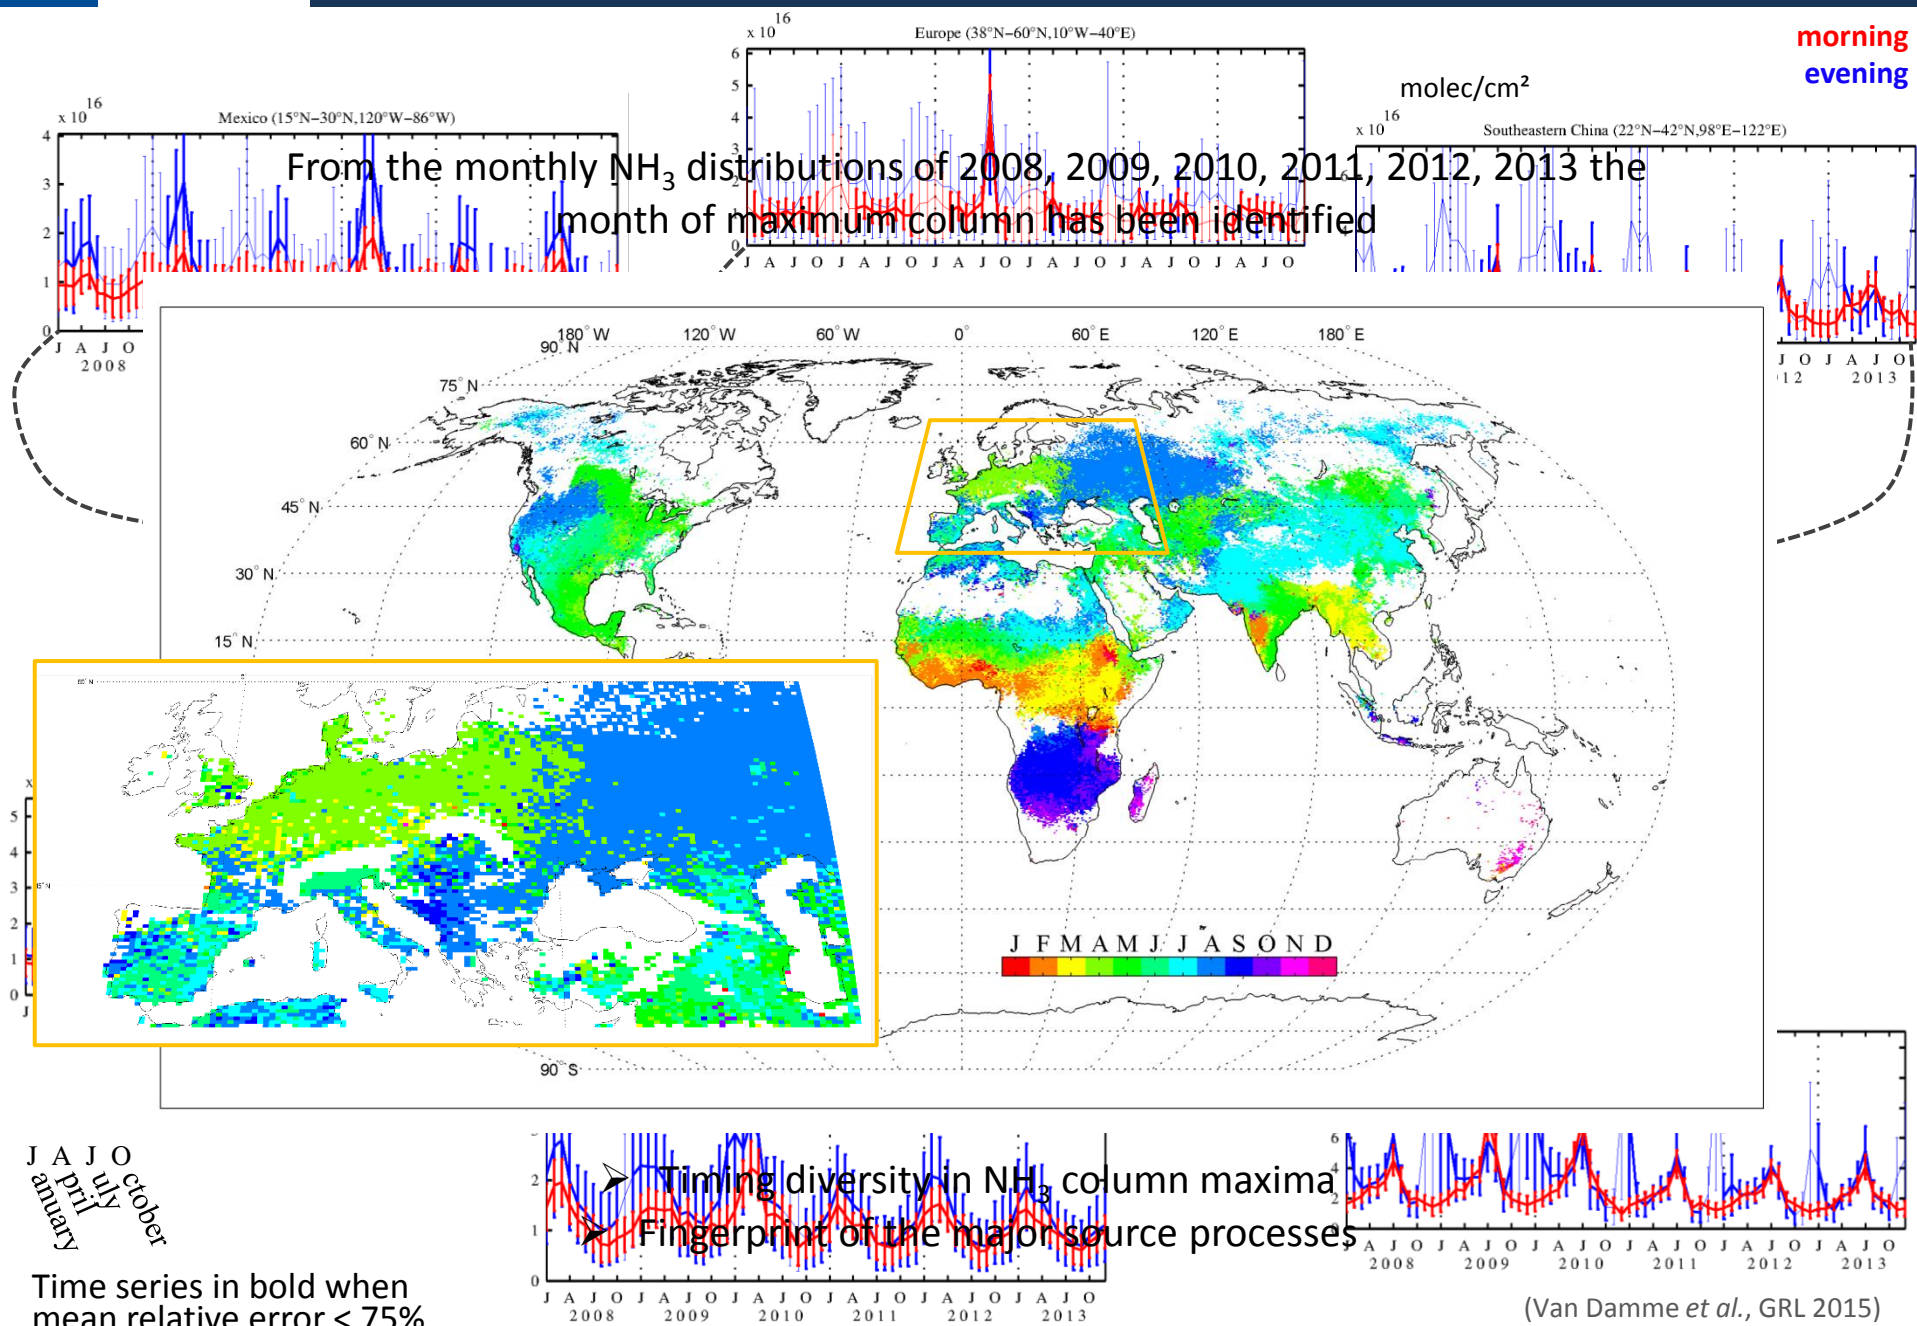

(Van Damme *et al.*, ACP 2014)

6-yr composite seasonal distributions over land (2008 → 2013)
Mean columns associated with a relative error > 75%
have been filtered out

(Van Damme *et al.*, GRL 2015)

Model comparison

Inter-annual variability
4-yr comparison (2008→2011)

○ = industrial hot spots

IASI - LOTOS-EUROS

mg/m^2

2008→2012 AM & PM weighted average
(excluding RU 2010 fire event period)

World's largest NH_3 producer in Togliatti, Samara Oblast, Russia

- 3 500*1000 metric NH_3 tons. yr^{-1}
- 85% exported
- World's longest NH_3 pipeline to Odessa, Black-sea

- **First time that industrial NH_3 sources are observed so clearly suggesting strong underestimation of emission in the inventories**

↗ L2 quality

(Van Damme
et al., JGR-
Atm 2014)

Model comparison

Intra-annual variability
4-yr comparison (2008→2011)

(Van Damme *et al.*, JGR-Atm 2014)

**Emission timing and gridding assessment:**

- Po Valley: recurring feature likely linked with wrong timing
- Ebro Valley: underestimated emission and/or misrepresentation of the diurnal profile
- Netherlands: best agreement (magnitude & timing)

→ expected as the fixed timing of the emissions are based on experimental data sets from this country

Applications

- Assessment of fire emissions inventories (Whitburn *et al.*, *Atm. Env.* 2015) [+Poster S3-34](#)

- Assimilation into CHIMERE model (Fortem-Cheney *et al.*, in revision for GRL) [+Poster S3-33](#)

- Significant impacts on (and increases of) PM concentrations
- Improve the comparison with independent surface measurements of NH_3 and PM

- >8 years of global (bi-)daily IASI-NH₃ data (IASI-A and IASI-B) available in open access via Ether website

Poster S4-50

- Flexible and robust **neural network** approach has been applied on IASI spectra

Poster S9-69

- Validation of IASI-NH₃: **Talk at 14:00 on Thursday (M. Zondlo)** Session 10
- Fire emissions assessment
- Assimilation into model

Poster S3-44

Poster S3-33

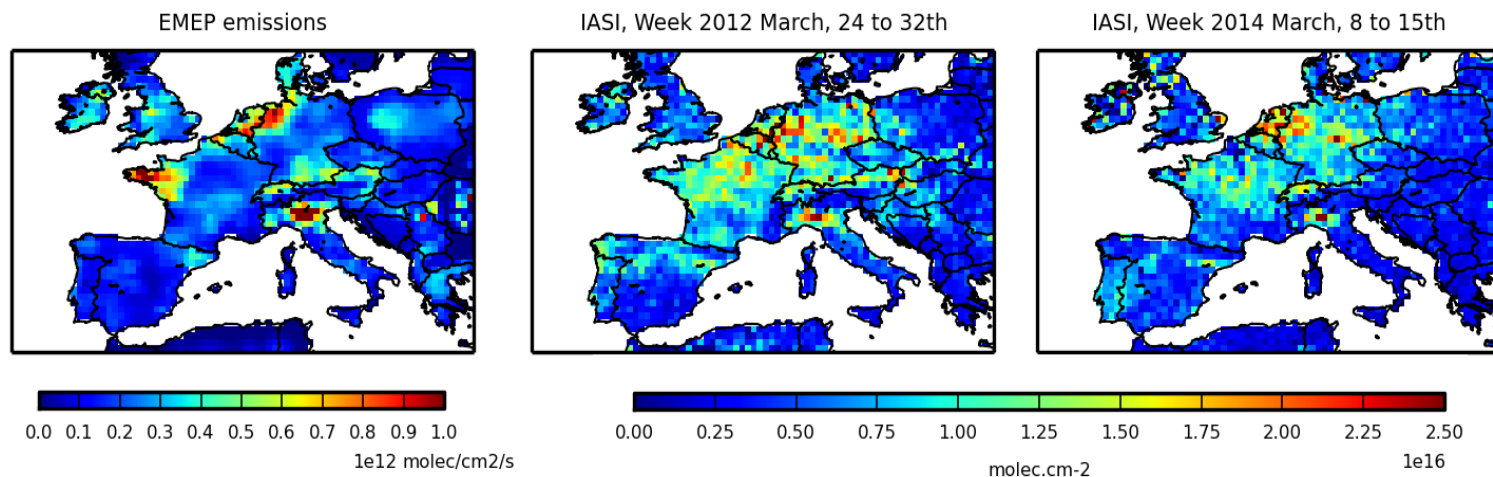

Thank you for your attention!

Applications

- Assessment of fire emissions inventories (Whitburn *et al.*, *Atm. Env.* 2015) [+Poster S3-34](#)

- Assimilation into CHIMERE model (Fortem-Cheney *et al.*, in revision for GRL) [+Poster S3-33](#)

- Significant impacts on (and increases of) PM concentrations
- Improve the comparison with independent surface measurements of NH_3 and PM

Validation

Ground-based observations

● = observations for 2011 from IDAF, AMoN, EMEP and NNDMN networks

Qualitative comparison:
IASI columns
vs. surface
abundances

National Nitrogen Deposition Monitoring Network (NNDMN)

2009 to 2013

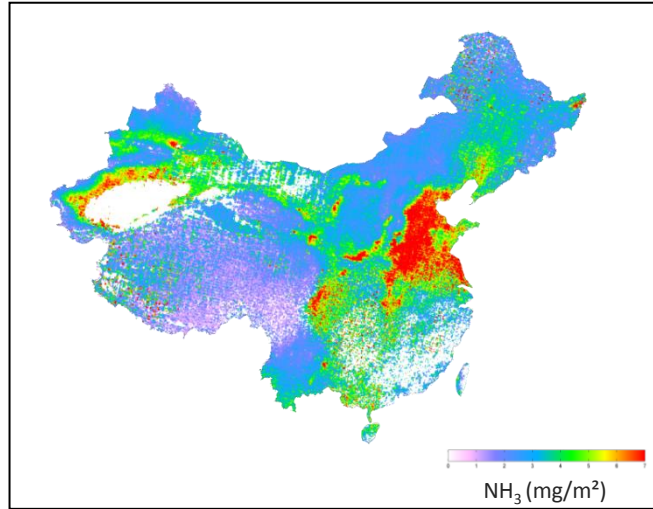

Satellite vs Emission Inventories

China

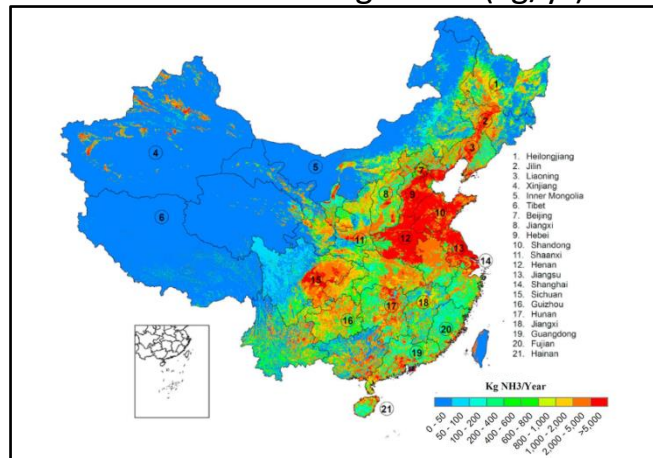

IASI satellite

IASI total columns in $0.05^\circ \times 0.05^\circ$ grid (mg/m^2)

Emissions inventory

Spatial distribution of ammonia emission in 1 km grid cell (kg/yr)

(Huang *et al.*, GBC 2012)

Po Valley

IASI total columns in $0.01^\circ \times 0.01^\circ$ grid (molec/cm^2)

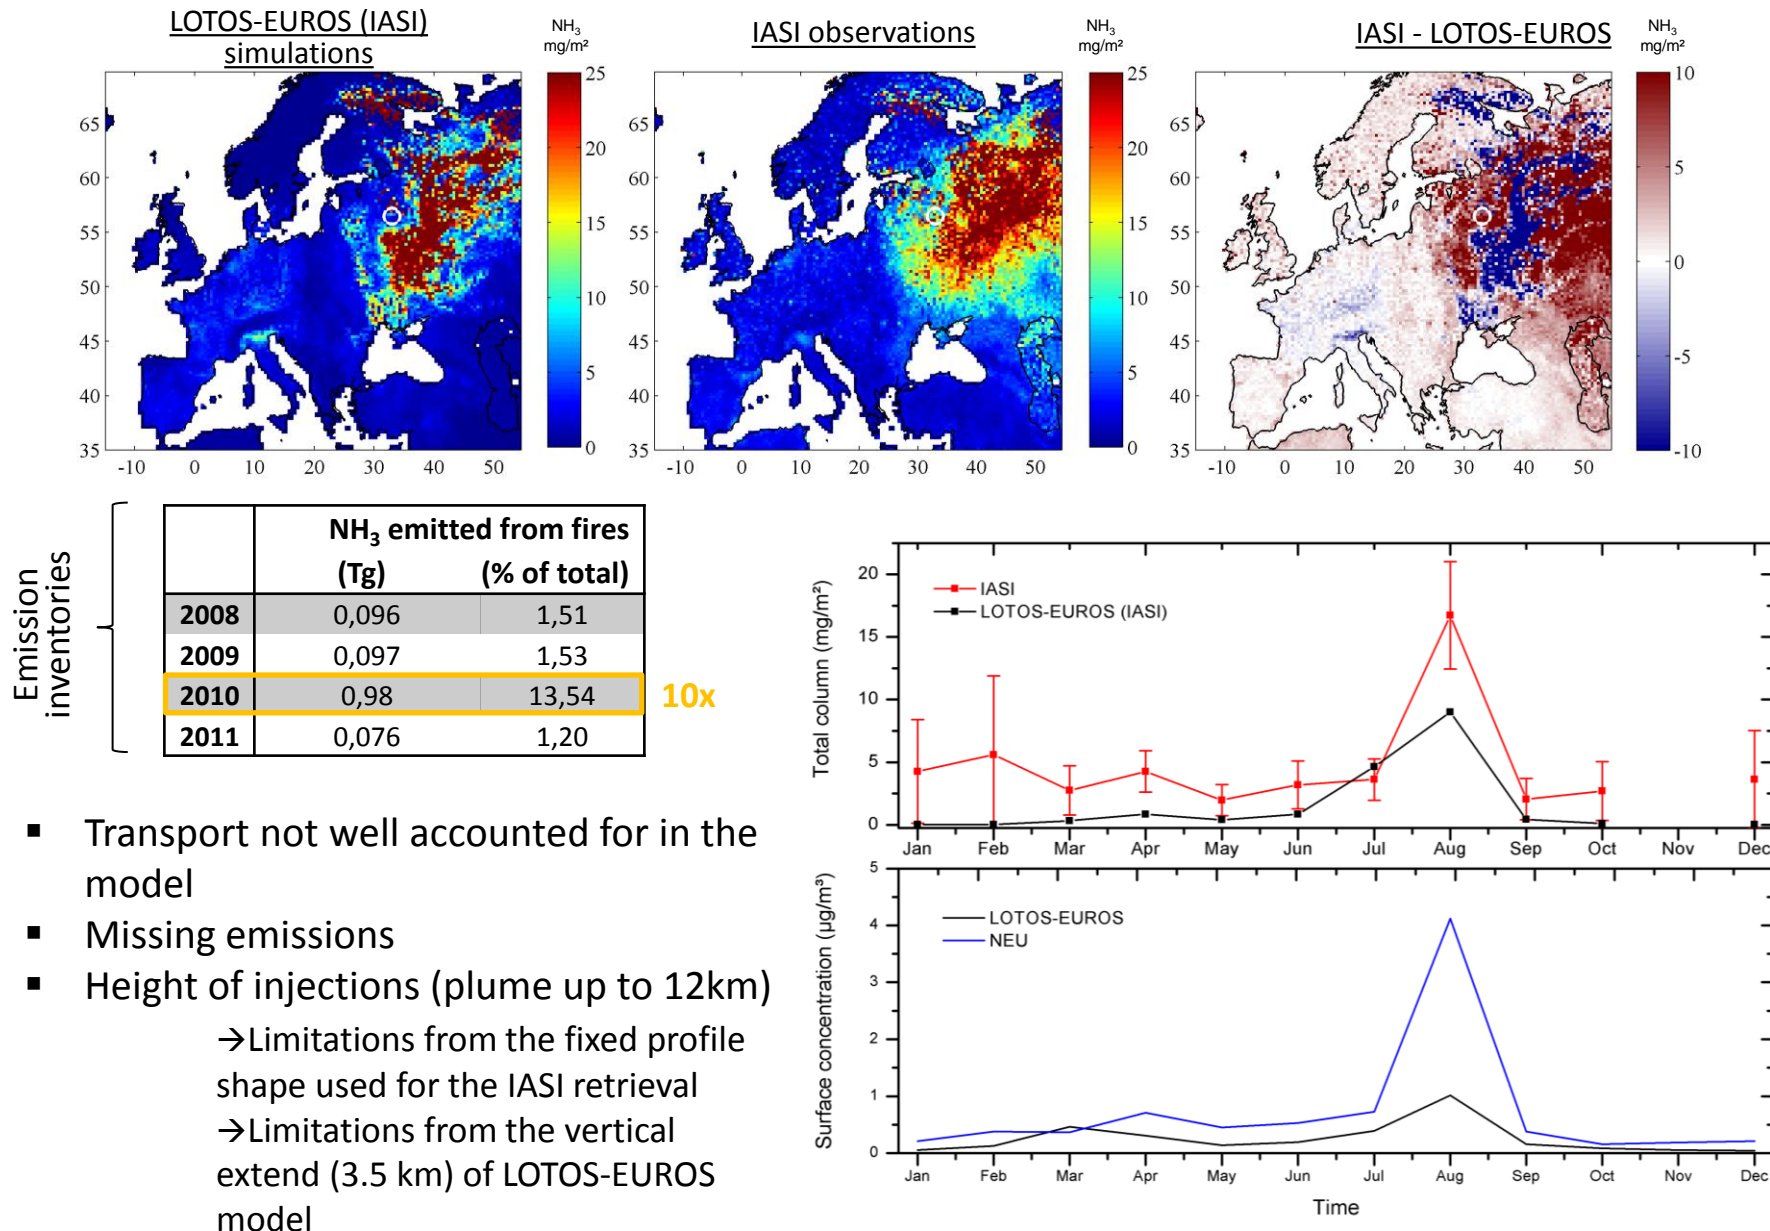

ARPA-ER inventory in 5 km grid cell (t/yr)

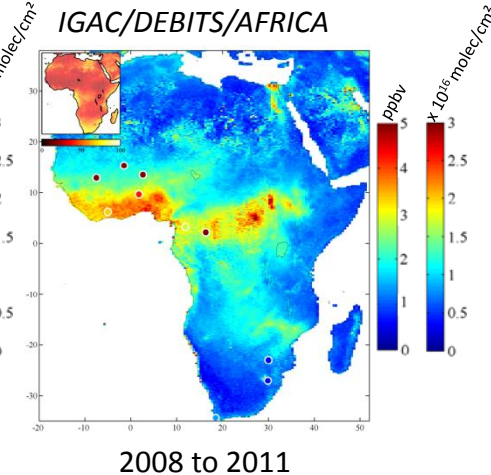

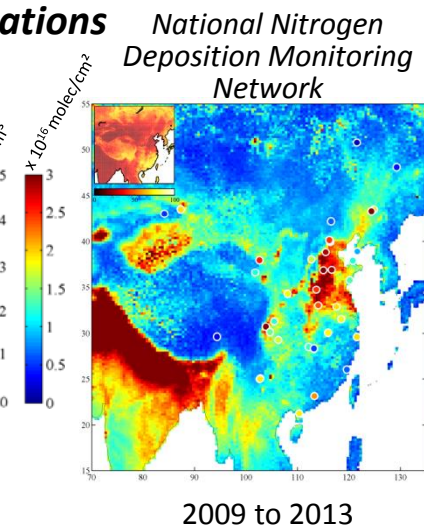

Russian fire episode in 2010

20 July to 20 August mean

Validation

Ground-based observations

Qualitative comparison: IASI columns vs. surface abundances

→ Use LUT profile to convert IASI-columns to IASI-surface abundances

(Van Damme *et al.*, AMT 2015)

Shangzhuang site (40.14°N, 116.18°E)

* = fertilization peaks of March, July and October 2013

Method (2) From HRI to NH₃ column ...using a neural network (NN)!

$$\text{NH}_3 \text{ column} = \text{HRI} \times f(T, T_{\text{surf}}, P, \text{H}_2\text{O}, \sigma, z_0, \epsilon, \text{angle})$$

(Whitburn *et al.*, accepted in JGR-atm)

Advantages:

- ✓ **Full atmospheric state** is taken into account as there is no limit on the number of input parameters
- ✓ **Full uncertainty analysis** is achieved by perturbing the input parameters
- ✓ **Reduced bias**, NN approach allowing negative columns
- ✓ **Flexible NH₃ profiles**:

Cases	1	2	3	4	5	6	7	8	9
% deviation from NH ₃ column based on land LUT (Van Damme <i>et al.</i> , 2014)	-53.4	-44.9	-32.2	-8.4	+11.8	0	+3	+14.9	+41.4
NH ₃ profile shape (* in km)	A *=0.1	A *=0.5	A *=1	A *=2	A *=3	B	C *=0.5	C *=1	C *=2
