

The 4th IASI Conference

11-15 April 2016, Antibes Juan-les-Pins, France

Assimilation of IASI surface-sensitive channels over land at convective scale AROME Model

Niama Boukachaba
PhD supervised by Vincent Guidard & Nadia Fourrié

CNRM, Météo-France and CNRS niama.boukachaba@meteo.fr

OUTLINE

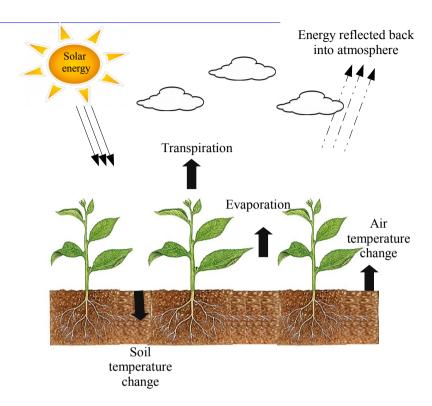

- 1 Motivation & Challenges
- 2 LST retrievals from IASI
- The impact of retrieved LST on the simulation and assimilation of IASI surface-sensitive infrared observations in the AROME model
- 4 Conclusions and prospects

The importance of Land Surface Temperature (LST)

- LST plays an important role in surface-atmosphere exchange [Niclòs et al., 2009].
- It is one of the key surface parameters which indicates the energy balance at the Earth's surface and is particularly relevant for domains such as agriculture, climatology, hydrology and weather forecasts [Kerr et al., 2004].

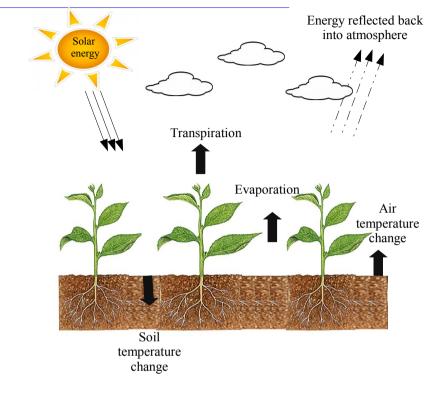

The importance of Land Surface Temperature (LST)

- LST plays an important role in surface-atmosphere exchange [Niclòs et al., 2009].
- It is one of the key surface parameters which indicates the energy balance at the Earth's surface and is particularly relevant for domains such as agriculture, climatology, hydrology and weather forecasts [Kerr et al., 2004].

- The estimate of the kinetic temperature of the earth's surface "skin" [Dickinson, 1994].
- LST from satellite observation is a challenging task due to the cloud cover and variation of surface emissivity.

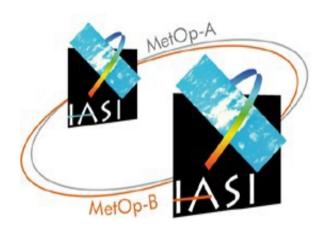

Surface emissivity

LST from IASI radiances

- IASI (Infrared Atmospheric Sounding Interferometer) is an IR hyperspectral sensor onboard polar orbiting satellites MetOp A & MetOp B.
- It contains 8461 channels operating between 645 and 2760 cm⁻¹ but less than 200 channels are assimilated in NWP centres.

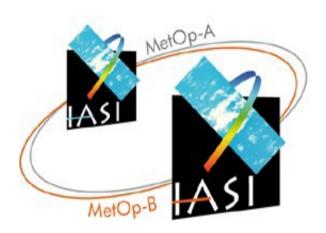

- IASI-A and B are on the same orbit with a 180° shift.
- ~50 min temporal shift.
- Off-nadir: from 0° to 39°, opposite angles.
- Regional averaging of the soundings (area 300 × 300 km or less). [Jouglet et al., 2013]

- Regional averaging of the soundings (area 300×300 km or less). [Jouglet et al., 2013]

Assimilation of IASI at Météo-France

- The assimilation of IASI in the AROME model is already well developed.
- More research is still needed to allow an increase of its use.

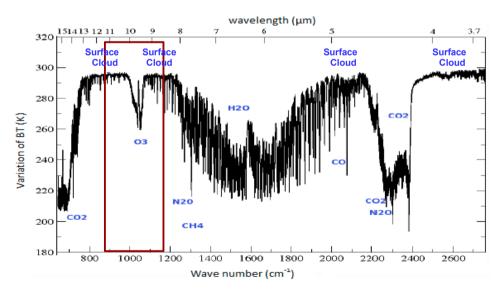

- Identification of the best IASI surface-sensitive channel for LST retrieval.
- Study the impact of this retrieved LST on the simulation and assimilation of IASI in AROME model.

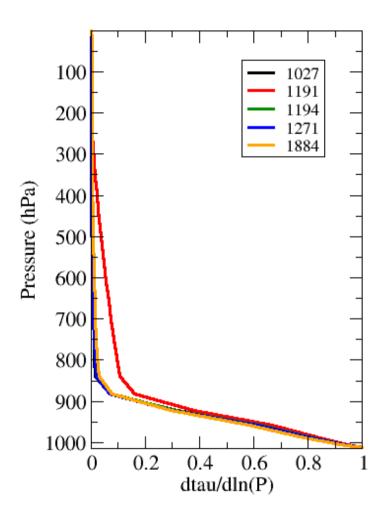

| IASI | | |
|----------|------------------------------------|--------------------|
| Channels | Wave number (cm ⁻¹) | Wavelenght (μm) |
| 1027 | 901.50 | 11.09 |
| 1191 | 942.50 | 10.61 |
| 1194 | 943.25 | 10.60 |
| 1271 | 962.50 | 10.39 |
| 1884 | 1115.75 | 8.96 |

Example of IASI spectrum in clear sky conditions

Weighting function of the 5 IASI surface-sensitive channels selected

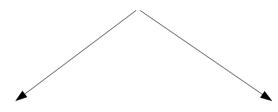

Radiative transfer equation inversion:

$$LST = L \left[\frac{R_{v}(\theta) - L_{v}^{1}(\theta) - \Gamma_{v}(\theta) (1 - \varepsilon_{v}(\theta)) L_{v}^{1}(\theta)}{\Gamma_{v}(\theta) \varepsilon_{v}(\theta)} \right]^{-1}$$

[Karbou et al., 2006]

 ϵv : surface emissivity, Γv : atmospheric transmission, L v and L v: atmospheric upwelling and downwelling radiances at channel v.

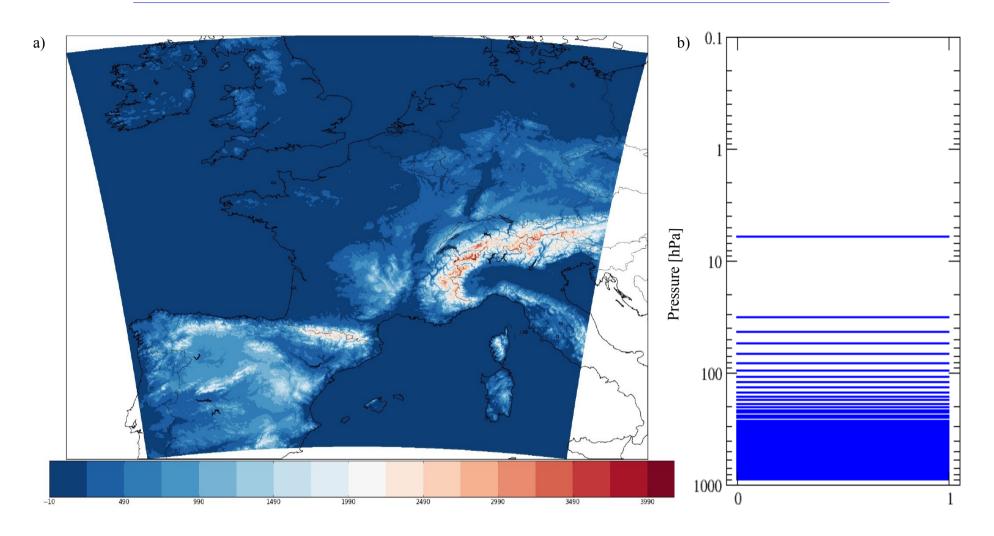

Atmospheric transmission, atmospheric upwelling and downwelling radiances were computed using **RTTOV model** v11.

For emissivity, we used:

- Constant emissivity equal to 0.98 (operational).
- **Emissivity atlas** developed by the Space Science and Engineering Centre at University of Wisconsin.

The geographical domain (a) and vertical levels (b) of AROME model (colours indicate orography in the Model). Horizontal resolution: 1.3 km, 90 vertical levels, 36 h forecasts every 3h and hourly 3DVar Data Assimilation.

Conditions of identification of the best IASI surface-sensitive channel

- Good surface representation with lower sensitivity to clouds and atmospheric molecules.
- ◆ Lower bias and standard deviation between background and retrieved LST.
- Best correlation with other IASI and SEVIRI channels LST.

Conditions of identification of the best IASI surface-sensitive channel

- Good surface representation with lower sensitivity to clouds and atmospheric molecules.
- Lower bias and standard deviation between background and retrieved LST.
- ♦ Best correlation with other IASI and SEVIRI channels LST.

Retrieved LST from IASI radiances

- Comparison of retrieved LST from IASI MetOp A vs MetOp B.
- Comparison between background and retrieved LST IASI.
- Inter-channels IASI LST comparisons.

Validation of IASI surface-sensitive channel

 Comparison of retrieved LST from IASI vs retrieved LST from SEVIRI and AVHRR.

◆ Using constant emissivity (0.98) vs emissivity atlas developed by the Space Science and Engineering Center at University of Wisconsin [Borbas et al., 2007].

Conclusions of this part of study

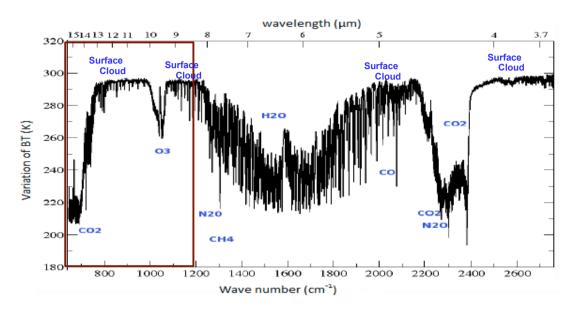

- IASI MetOp A & MetOp B produce similar LST retrievals.
- The use of variable emissivity provides a more realistic LST.
- The comparison between retrieved LST from IASI and SEVIRI radiances present good results allowing to study the complementarity between polar and geostationary satellite (good results also comparing retrieved LST from IASI with retrieved LST from AVHRR).
- The comparison between channels in AROME model enable us to keep only the relevant IASI channels for temperature retrieval (the same results in the global ARPEGE model): we chose channel 1191.

| EXP | LST retrieved from IASI channel 1191 used for IASI BTs simulation |
|-----|---|
| REF | LST from AROME forecast (= operations) used for IASI BTs simulation |

Example of IASI spectrum in clear sky conditions

- Study period: from January 15th to February 28th 2015.
- Emissivity atlas.
- Analyse sea/land.
- Clear/cloudy pixels according to AVHRR and McNally & Watts algorithms.

Using retrieved LST in the AROME assimilation IASI clear observations according to AVHRR without bias correction (from January 15th to February 28th 2015) Day Night Bias [K] Channel number Channel number OBS-GUESS--REF OBS-GUESS--REF 0.5 Bias [K] 0 -0.5 -0.5 -1 Wavenumber [cm-1] Standard deviation [K] Channel number Channel number 3.5 3.5 Standard Deviation [K] 2.5 Standard Deviation [K] 2 0.5 0.5

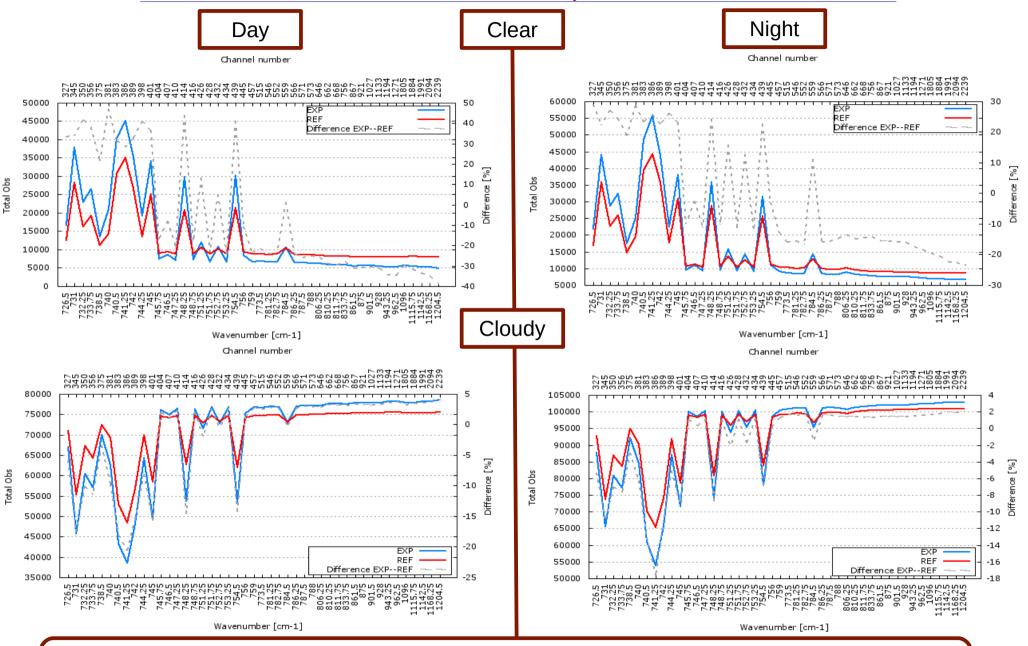

Bias [K]

The Obs-Guess of EXP and REF (combined IASI data from MetOp A & B) is very similar at daytime. A small difference is observed in surface-sensitive channels. At night-time, Obs-Guess of REF decreases. However, Obs-Guess of EXP changes a little. The StdDev was reduced in EXP compared to REF for both cases with large difference in surface-sensitive channels.

Wavenumber [cm-1]

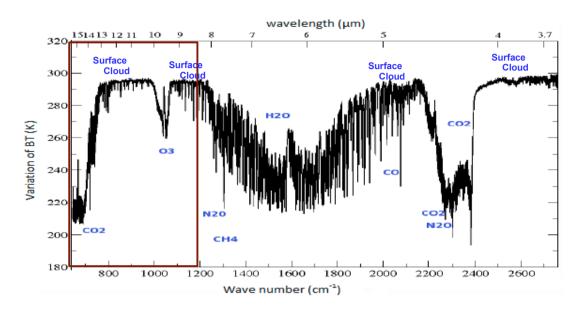

Wavenumber [cm-1]

Total clear/cloudy channels according to McNally & Watts algorithm within to clear pixels according to AVHRR from 15th to 30th January 2015

Both at daytime and night-time, the impact on cloud detection provides more clear channels in EXP than in REF ($\sim +30\%$) for atmospheric channels. The clear channel number is slightly decreased. This may be due to incorrect bias correction.

| EXP | LST retrieved from IASI channel 1191 used for IASI BTs simulation |
|----------|---|
| EXP_FULL | Idem to EXP but assimilation over land of channels selected over sea |
| REF | LST from AROME forecast (= operations) used for IASI BTs simulation |

The 4th IASI Conference, 11-15 April 2016, Antibes Juan-les-Pins, France

Total clear/cloudy channels according to McNally & Watts algorithm within to clear pixels according to AVHRR from 15th to 30th January 2015

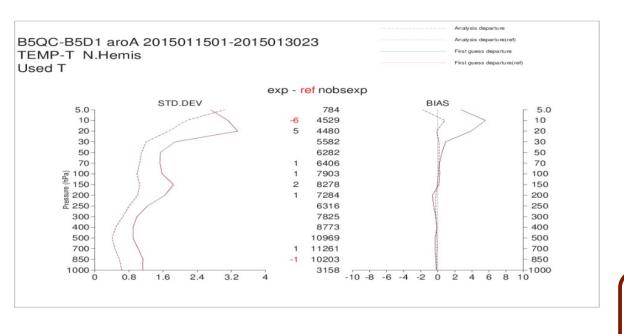

Impact on assimilated observation number (EXP--FULL – EXP) from 15th to 30th January 2015

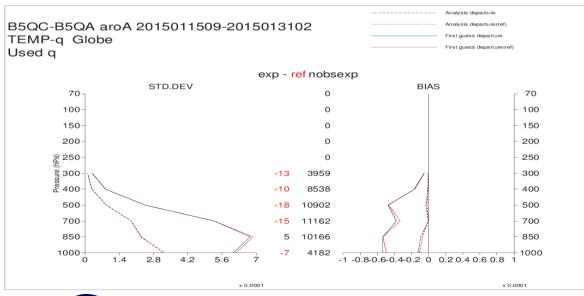

More observation assimilated in EXP--FULL up to 60% comparing to EXP.

Impact on the assimilation of other observation types (EXP-EXP--FULL)

Neutral impact on the assimilation of temperature data and slightly positive impact on the assimilation of humidity data (e.g radiosounding and ATMS sounder).

Conclusions and prospects

Conclusions -

- The comparison between channels in AROME model enable us to keep only the relevant IASI channels for temperature retrieval (the same results over global ARPEGE model): we chose channel 1191.
- The use of retrieved LST for IASI BT simulation leads to a decrease of the bias and the standard deviation of the difference between observations and background simulations, especially for surface-sensitive channels leading to an increase of assimilated channel number (more or less 50%).
- The first results of surface-sensitive channel assimilation with retrieved LST are encouraging and present a slightly positive impact on the analysis especially for humidity.

Future work •

- Evaluate the improvement of assimilation and forecasts over the AROME-France domain.
- Improve the bias correction over land.
- Extend the methodology developed for IASI to other sensors like CrIs and prepare the assimilation of the new hyperspectral sensors such as IRS and IASI-NG over continents.
