

IASI measurements of tropospheric ozone over megacities

G. Dufour¹, M. Eremenko¹, J. Orphal²,
J.-M. Flaud¹

¹LISA – CNRS – Université Paris-Est - France

²IMK – KIT Karlsruhe - Germany

Outline

- Tropospheric ozone retrieval
 - Validation of our product
 - Tropospheric ozone over Chinese megacities
 - Monthly variations
 - Daily variations
-

Retrieval and data processing at LISA

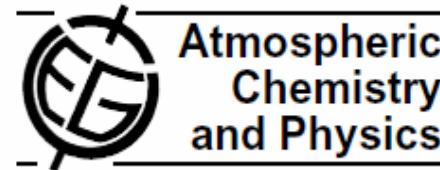

- IASI L1 data through the ETHER database (France)
- RTM: KOPRA and associated retrieval code (KOPRAFIT)
- Filtering for clouds using
 - Surface temperature
 - Baseline distortion
- Temperature profiles using CO₂ bands (instead of L2 data)
- O₃ profiles using an altitude-dependent regularization based on Tikhonov-Philips method.
- details: *Eremenko et al., Geophys. Res. Lett. , 2008*

First validation exercise using ozone sondes

- Focus: midlatitudes
- Coincidence criteria
 - Spatial: ± 100 km
 - Temporal 12 hours
- Differences in the vertical resolution → smoothing the sonde profiles
$$\mathbf{x}_{\text{smoothed}} = \mathbf{x}_{\text{a priori}} + \mathbf{A}(\mathbf{x}_{\text{sonde}} - \mathbf{x}_{\text{a priori}})$$
- Comparisons with ozone sondes but also intercomparisons with other scientific and operational products

First validation exercise using ozone sondes

Results - northern midlatitudes

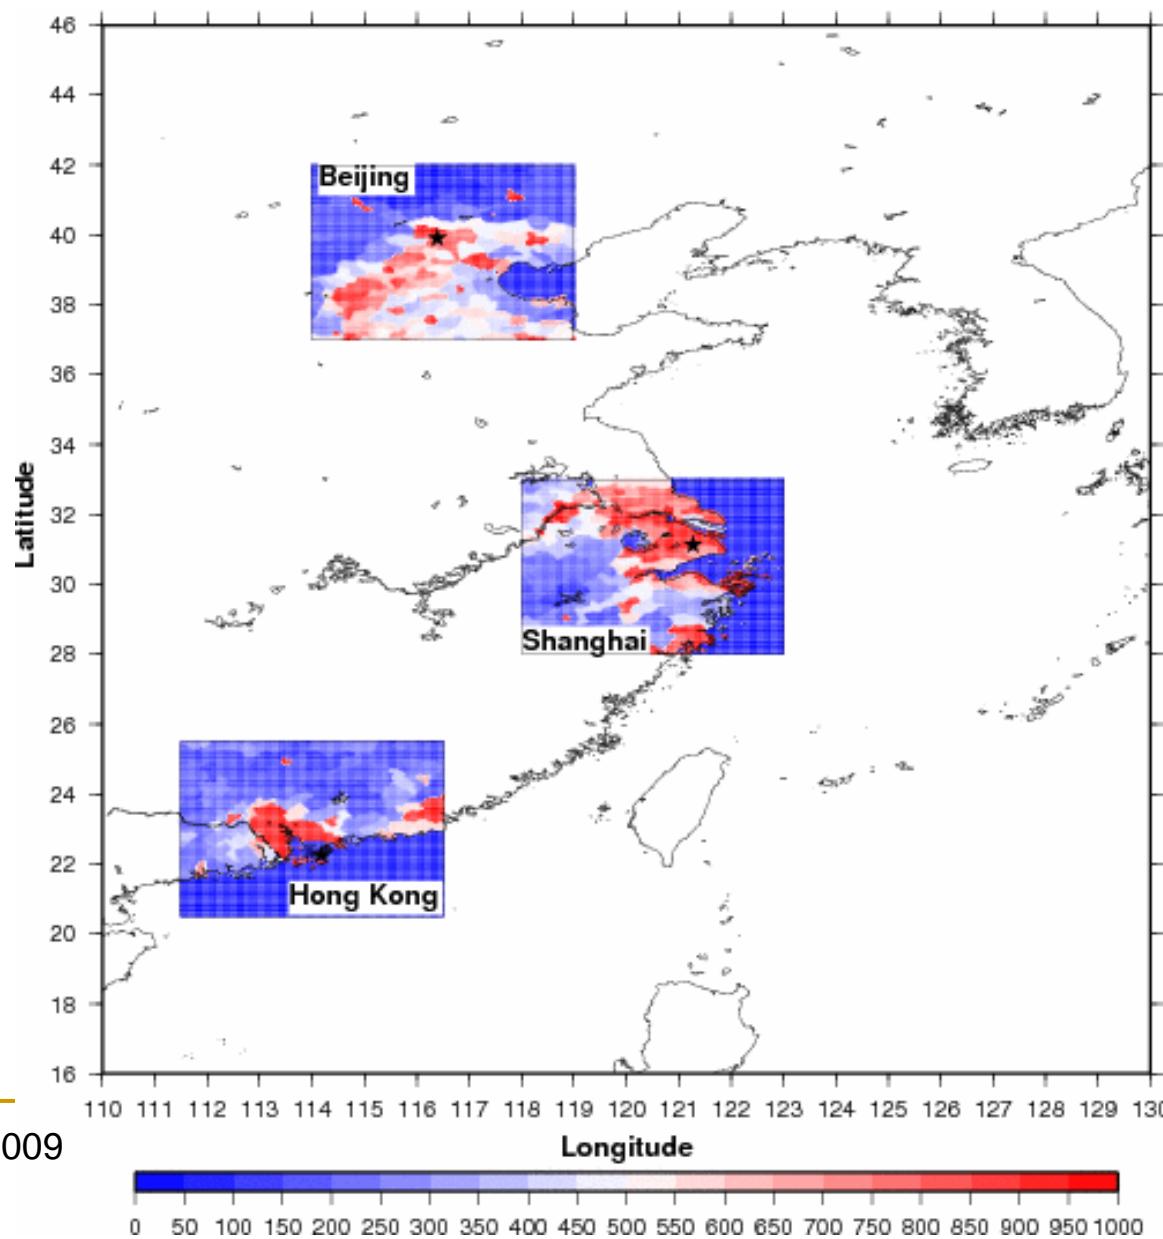

Our product:

- small bias < errors
- std ~ errors

Operational products (v4.2)

- significant bias in the lower troposphere
- similar to scientific product for tropospheric column

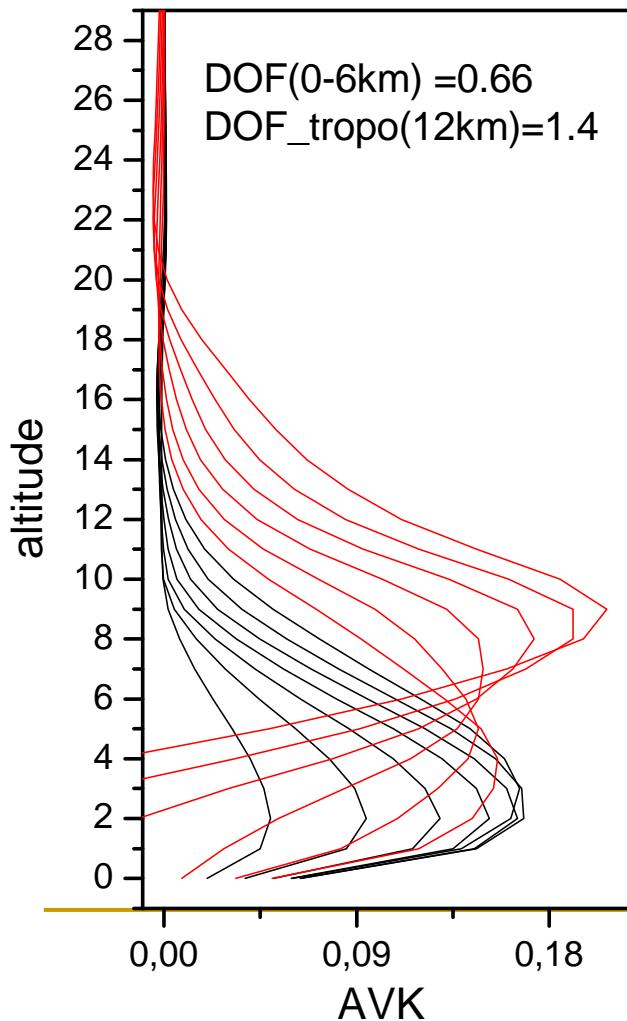

Chinese Megacities

Vertical sensitivity

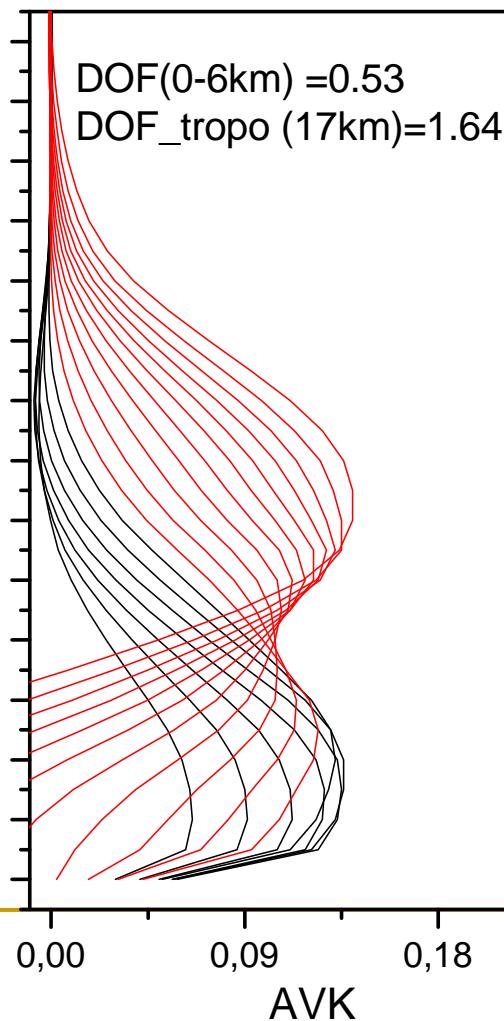

Beijing 16.04.2008

$$\begin{aligned} T_{\text{surf}} &= 302.5 \text{ K} \\ \Delta T &= 17.7 \text{ K} \end{aligned}$$

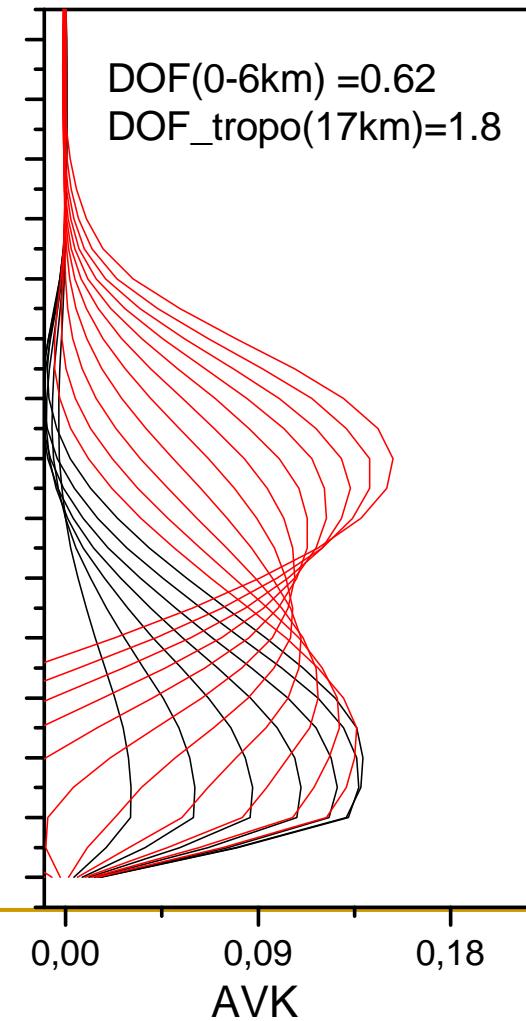

Shanghai 4.06.2008

$$\begin{aligned} T_{\text{surf}} &= 298.9 \text{ K} \\ \Delta T &= 11.0 \text{ K} \end{aligned}$$

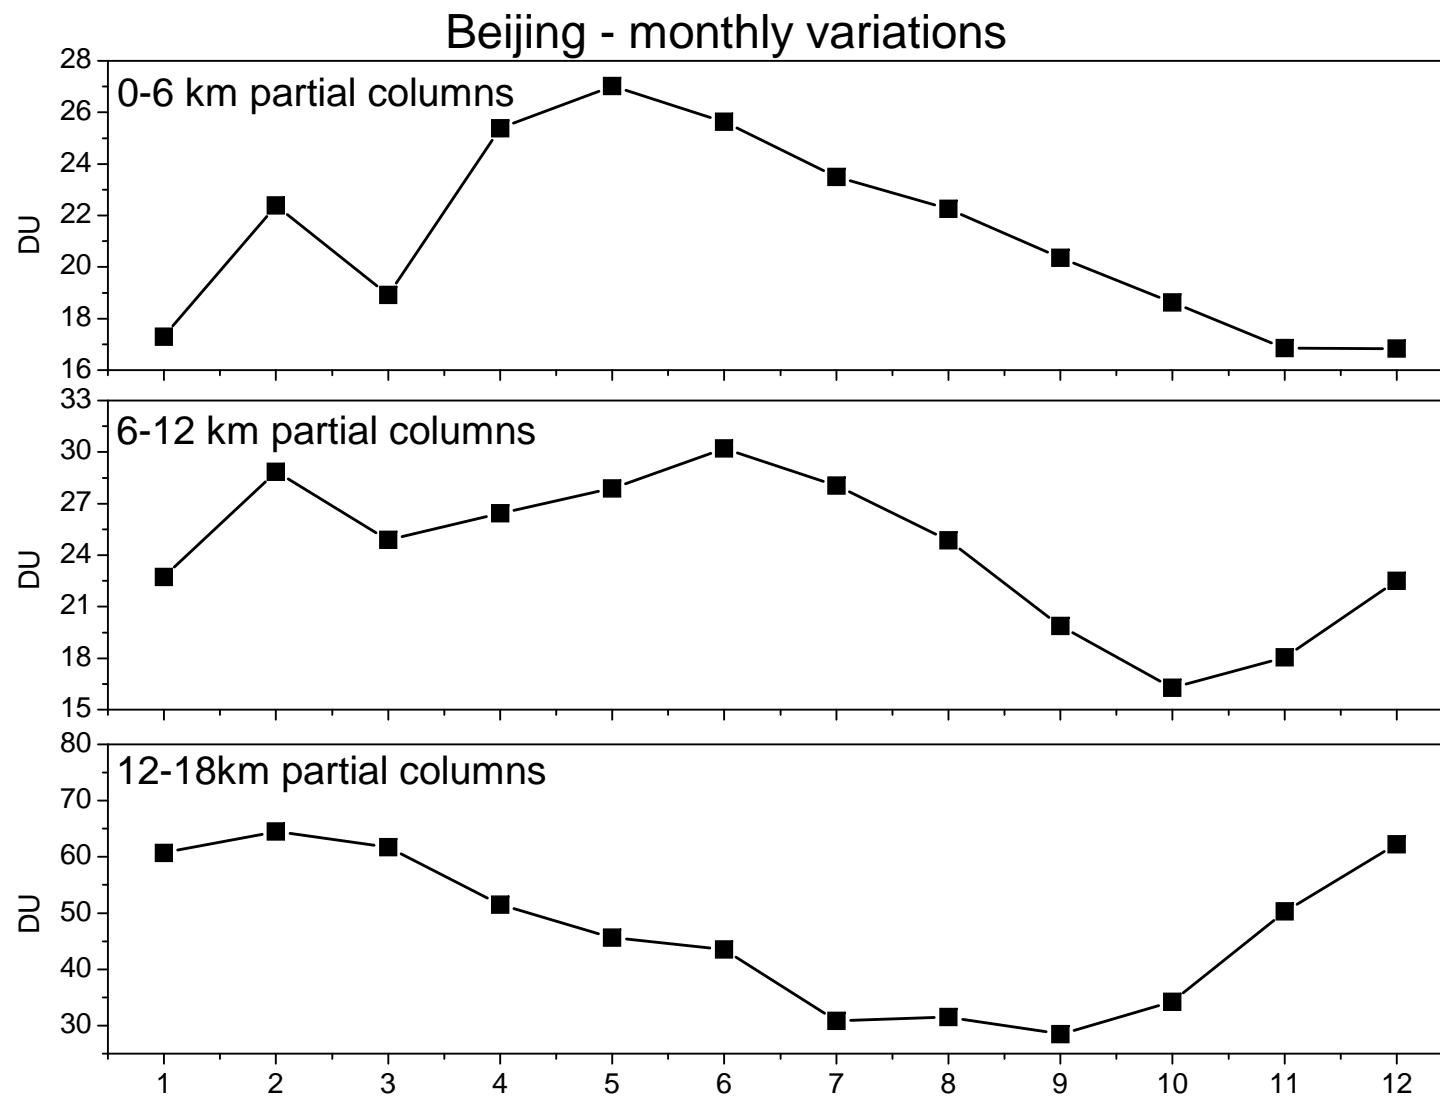

Hongkong 12.05.2008

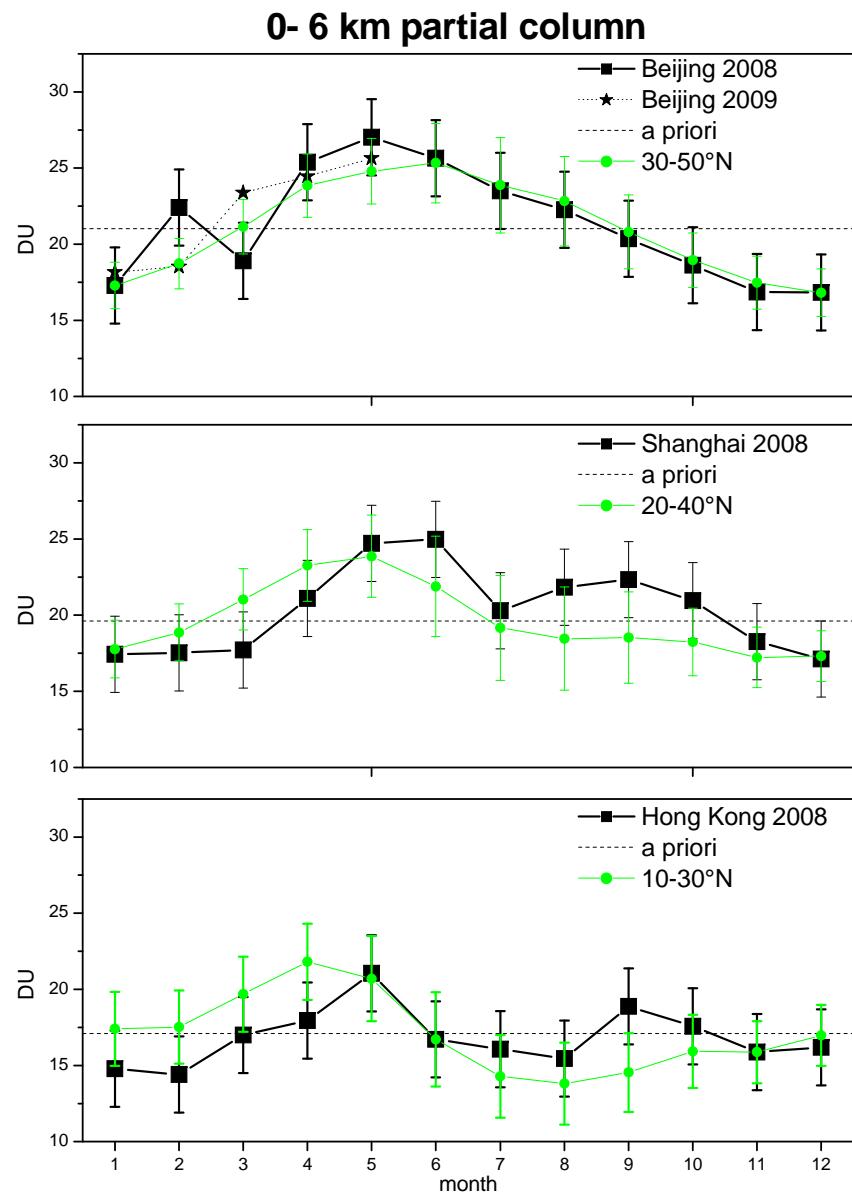

$$\begin{aligned} T_{\text{surf}} &= 298.5 \text{ K} \\ \Delta T &= 8.9 \text{ K} \end{aligned}$$

Columns in the LT and in the UT/LS

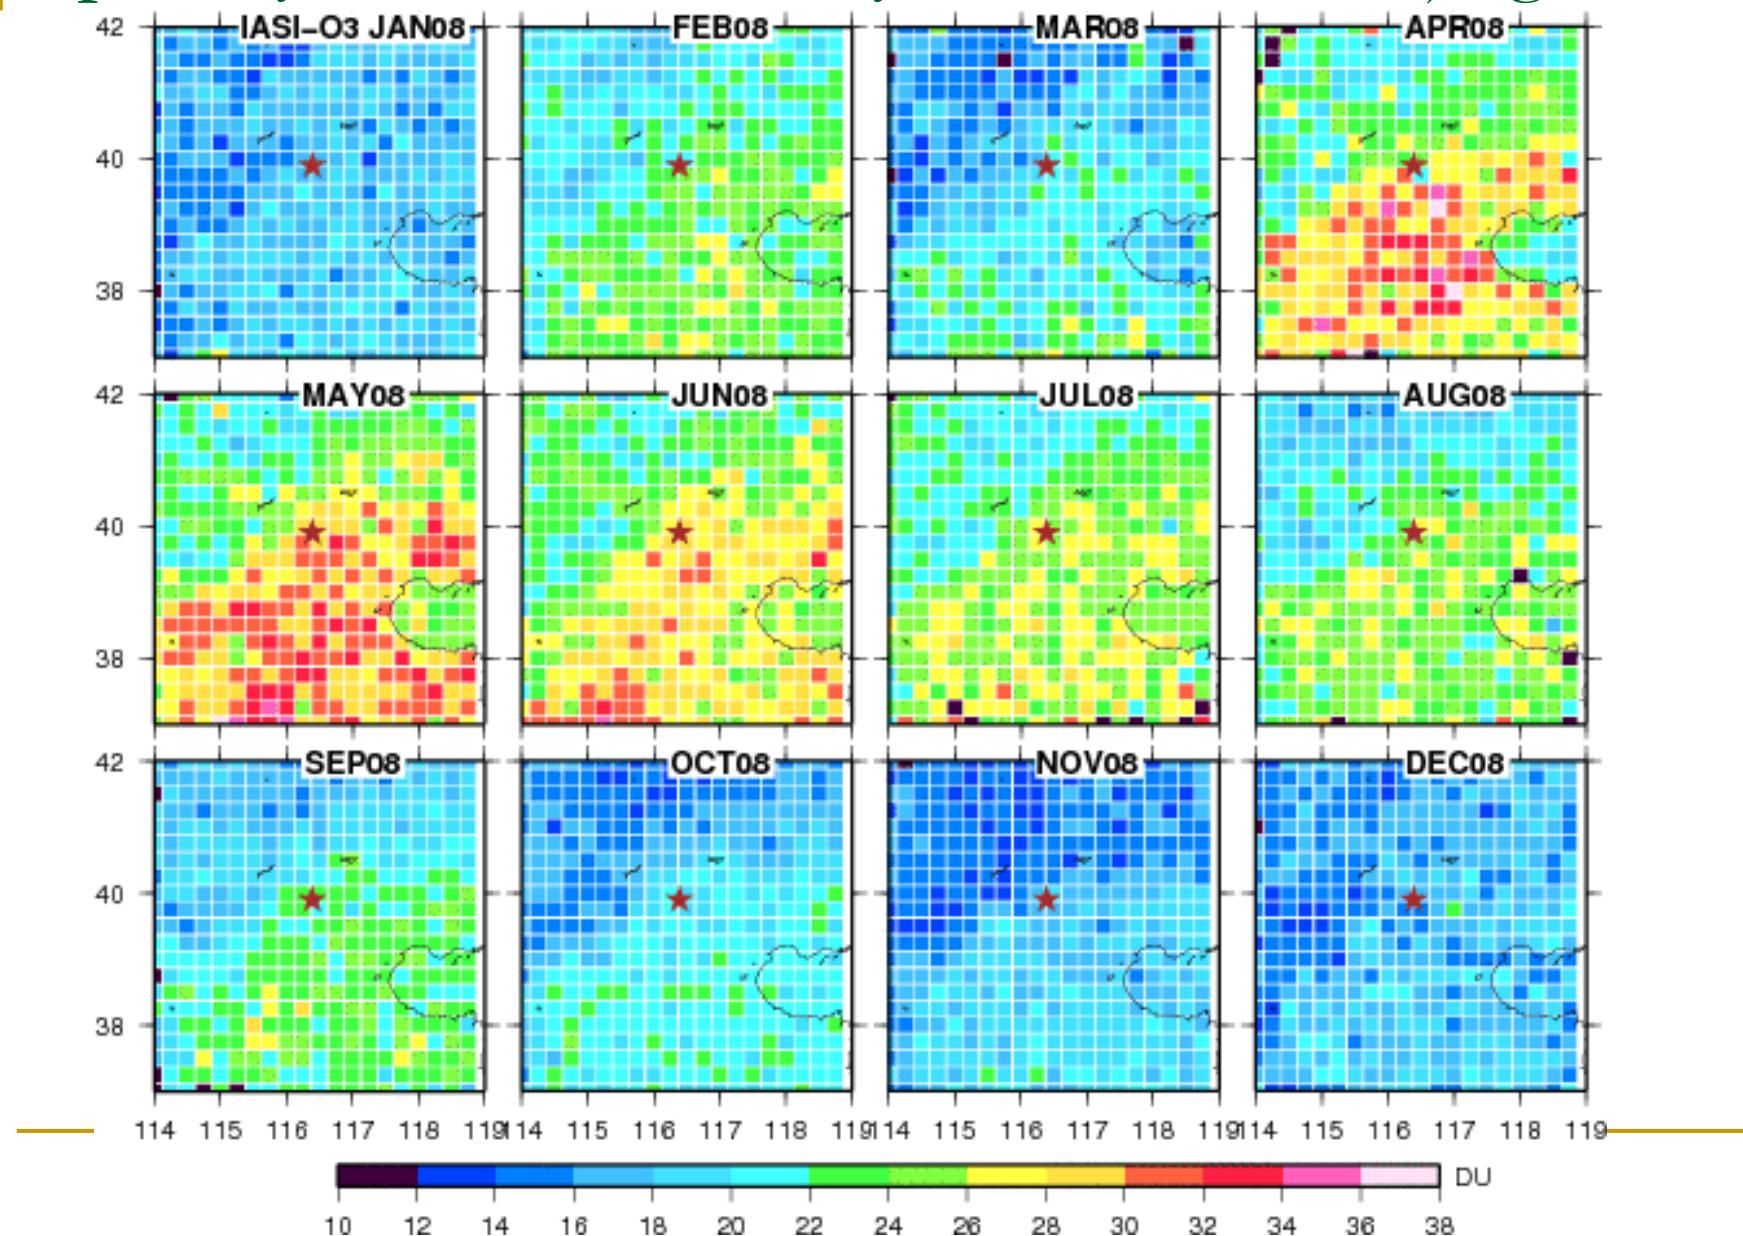

Monthly variations

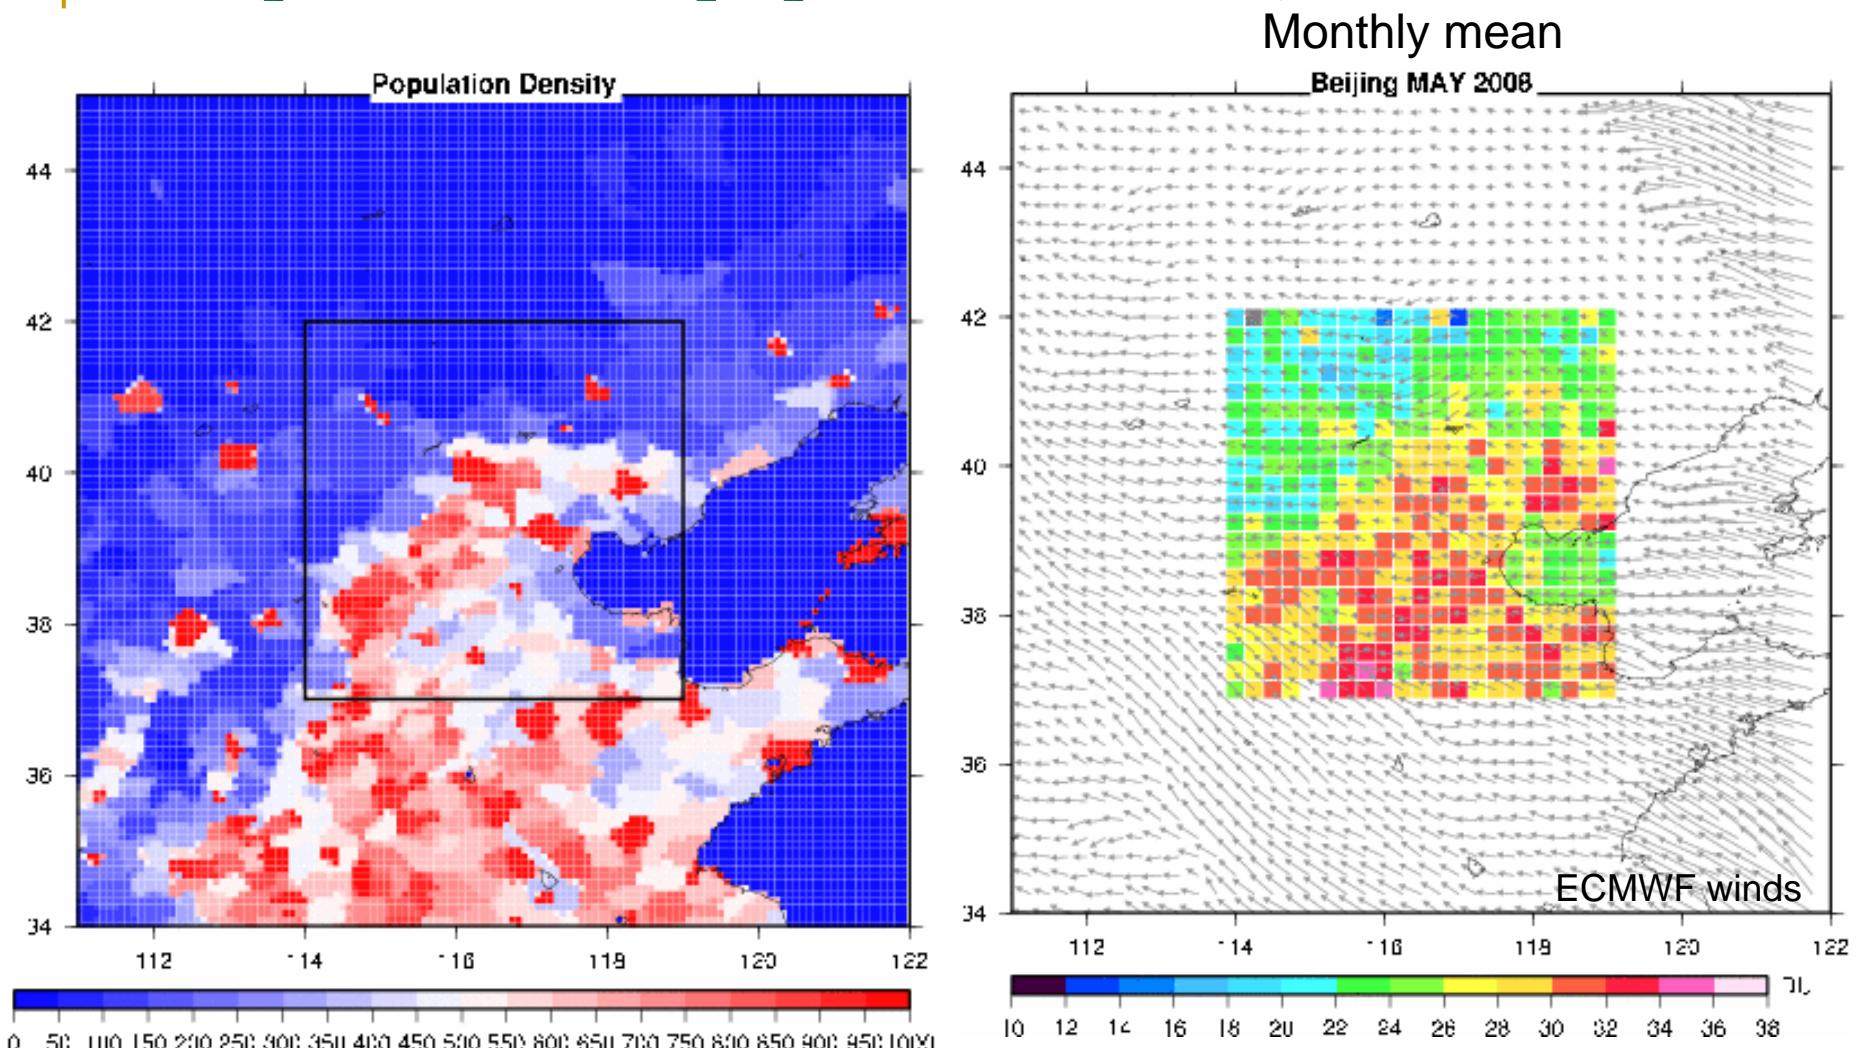

- Sharp maximum in late spring and early summer
 - Early summer decrease in Beijing
 - Summer minimum in Shanghai and Hong Kong
- Asian summer monsoon influence
- Second maximum in fall in Shanghai and Hong Kong:
 - enhanced photochemical production due to polluted period?

Spatially resolved monthly variations - Beijing

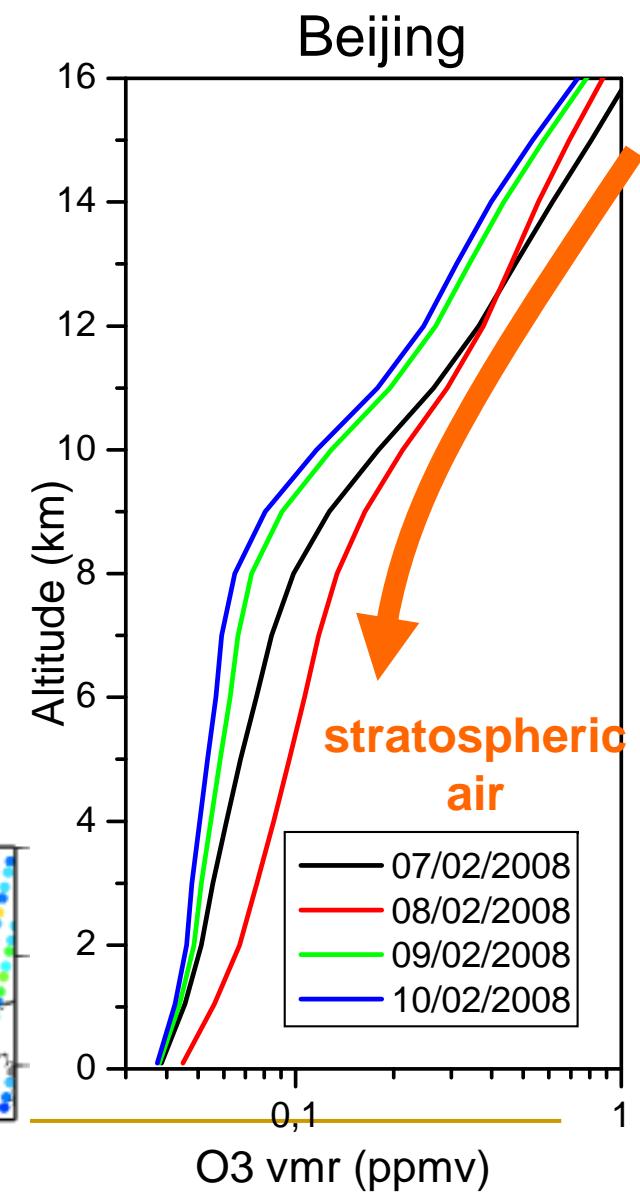

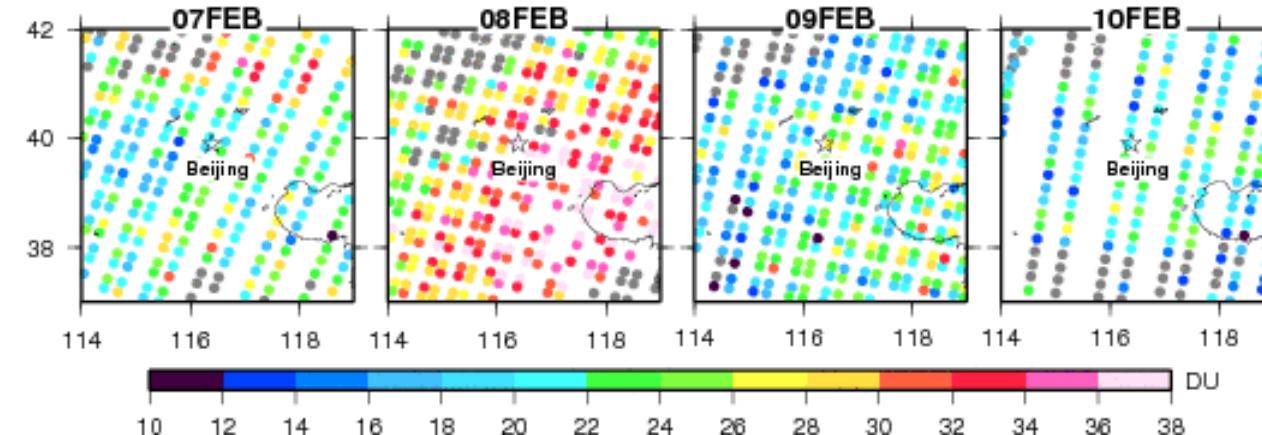

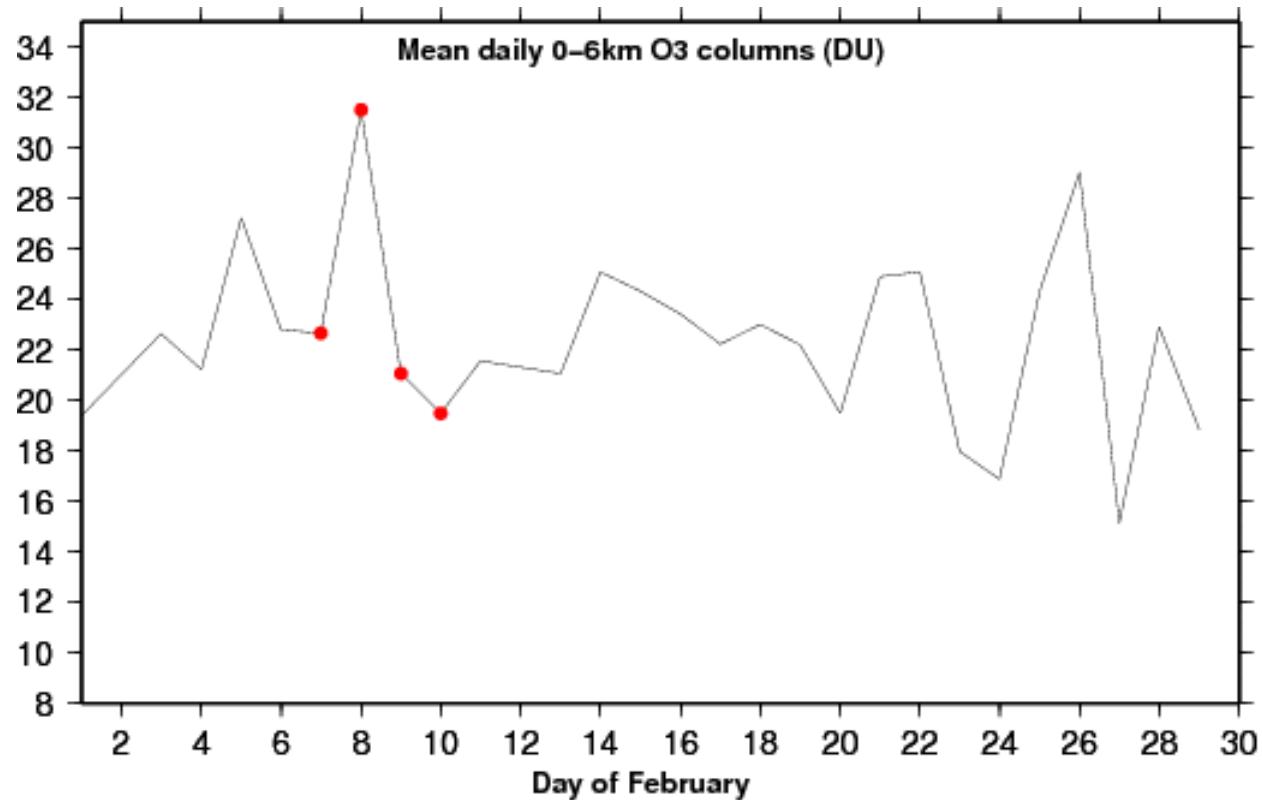

Comparison with population density

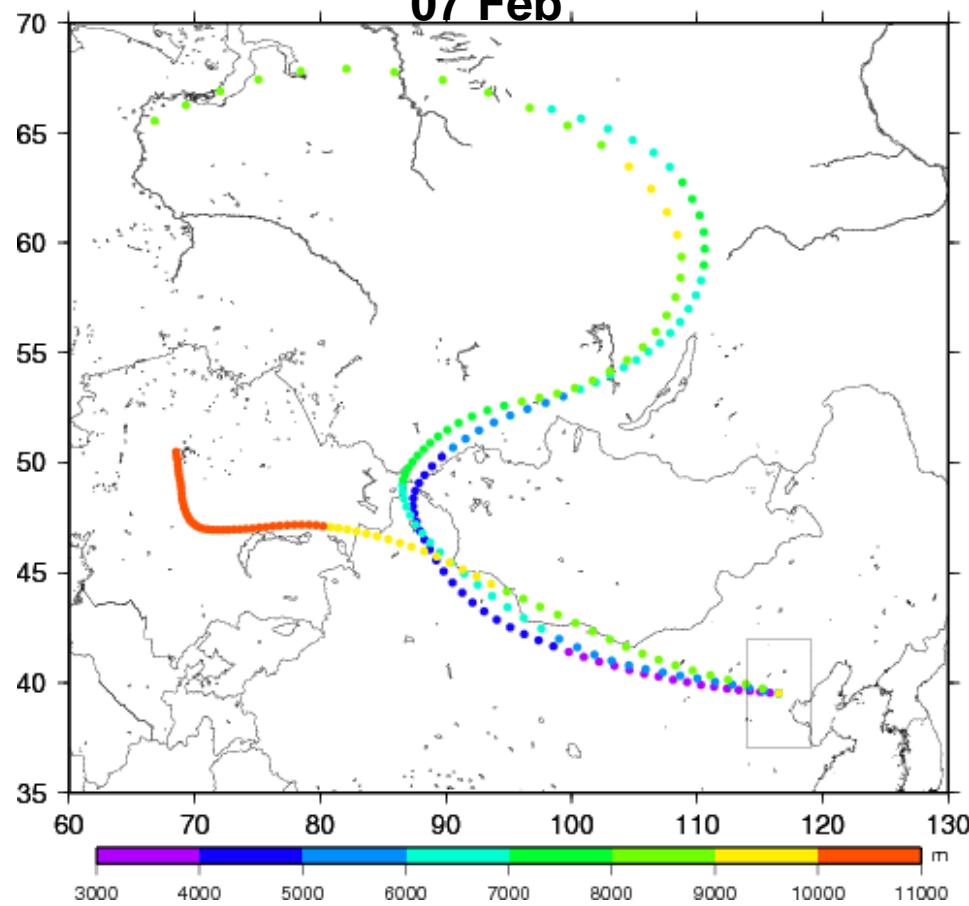

- Consistency between population density, wind direction and large ozone
- Anthropogenic and/or biomass burning origin of the large ozone values

Daily variations – Beijing – stratospheric origin

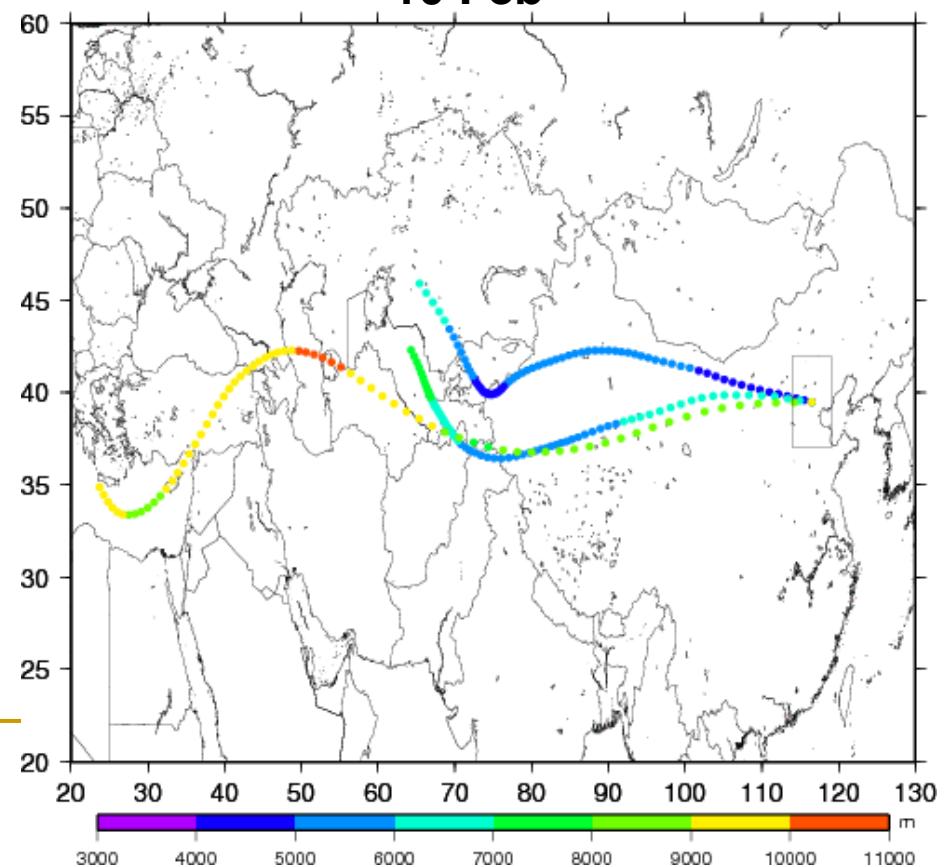

Backtrajectories at 4, 6 and 9 km

07 Feb

On February 7th, air masses are coming from North West and from higher altitudes

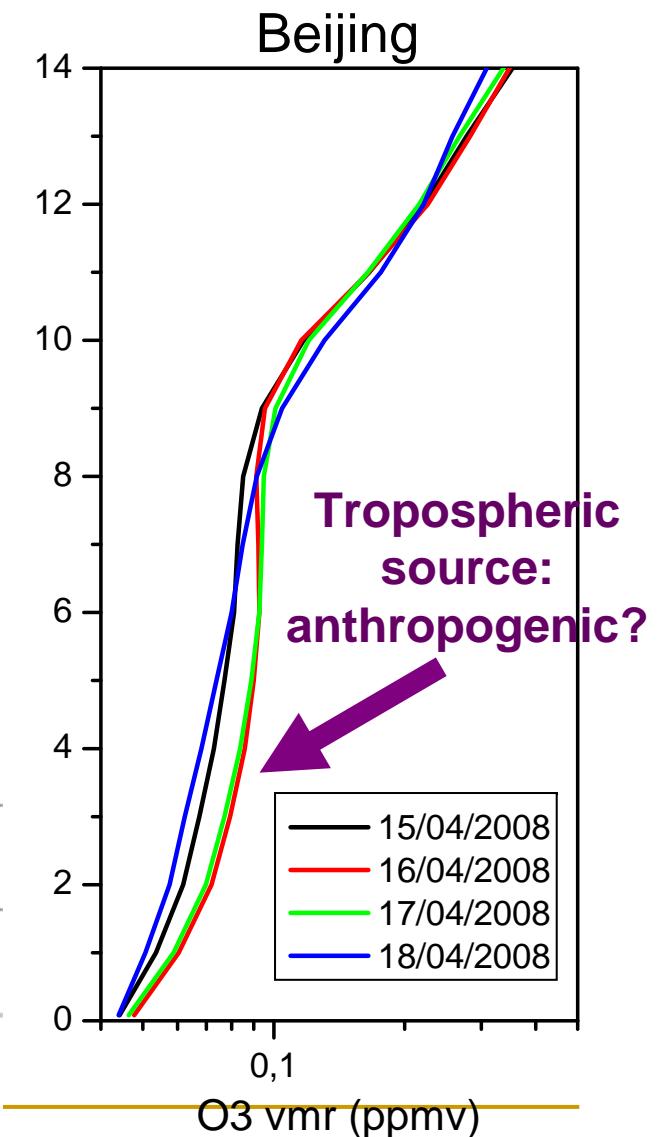

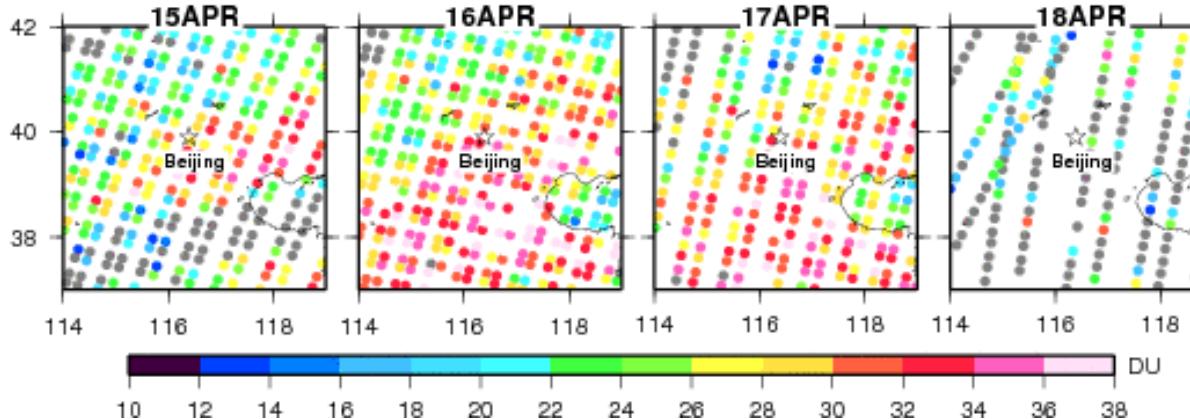

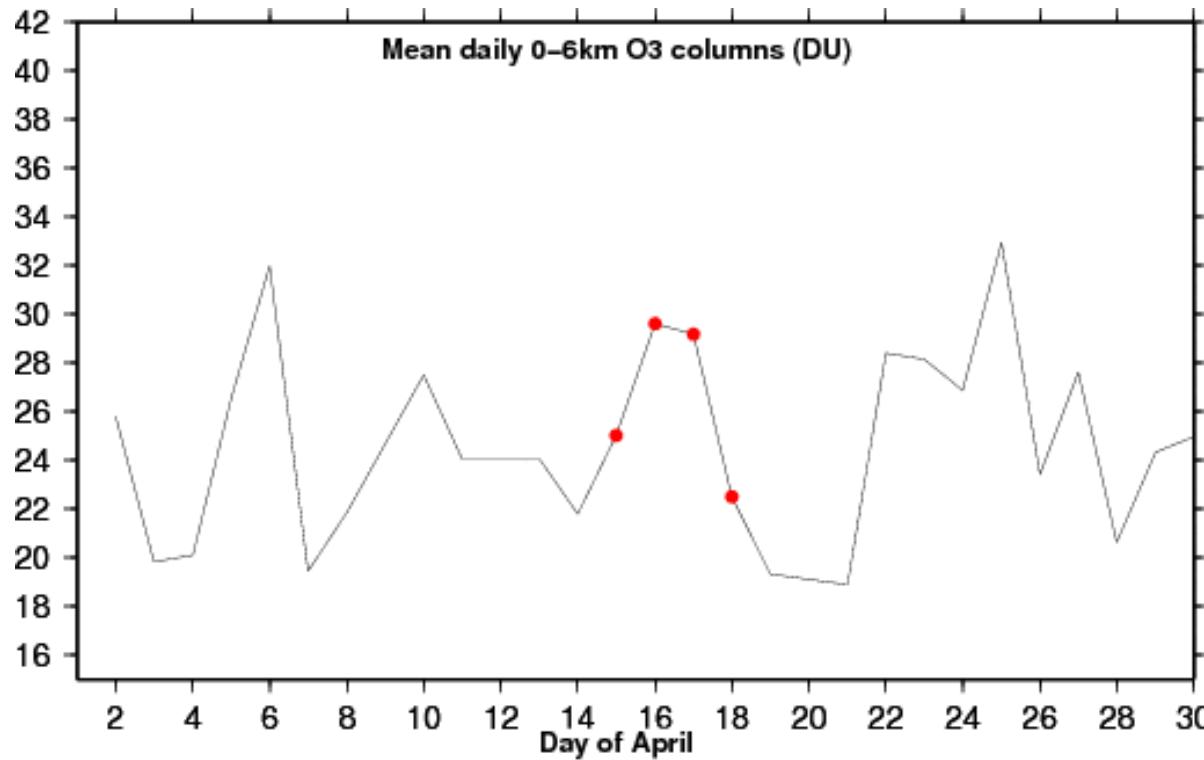

10 Feb

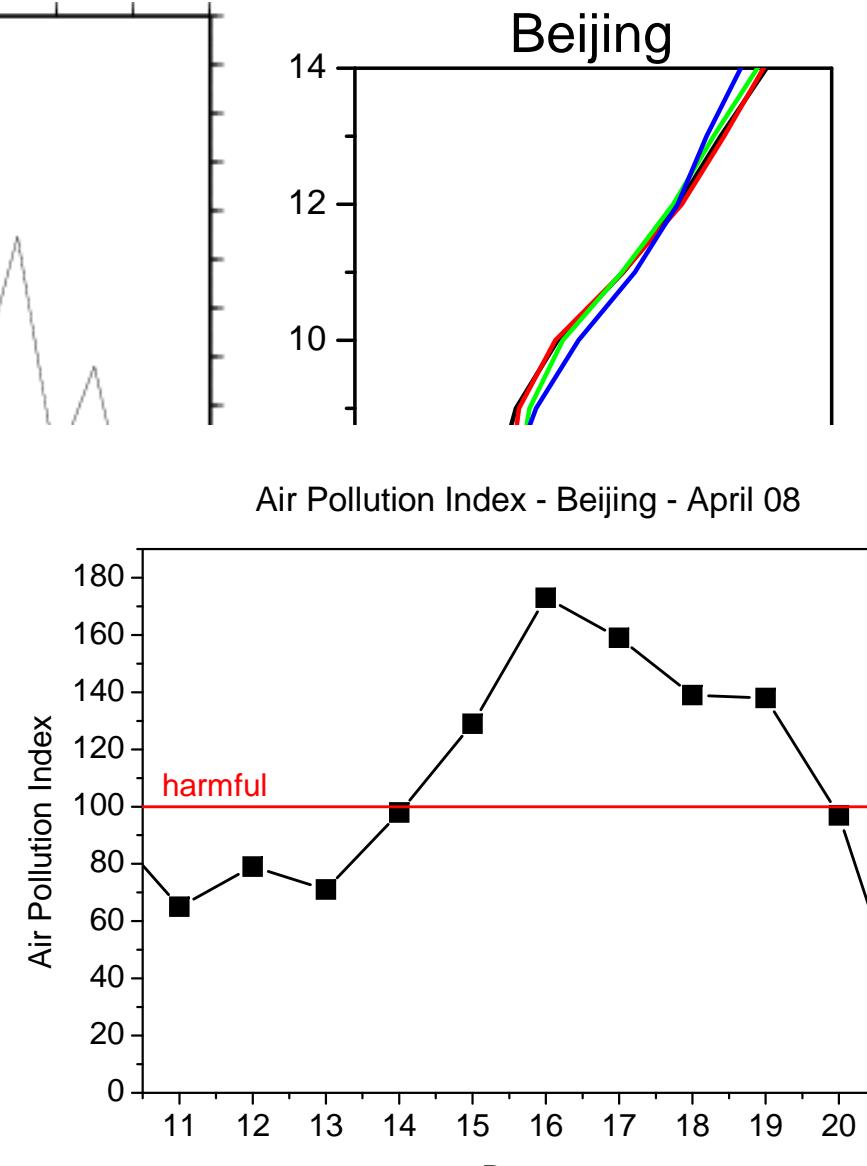

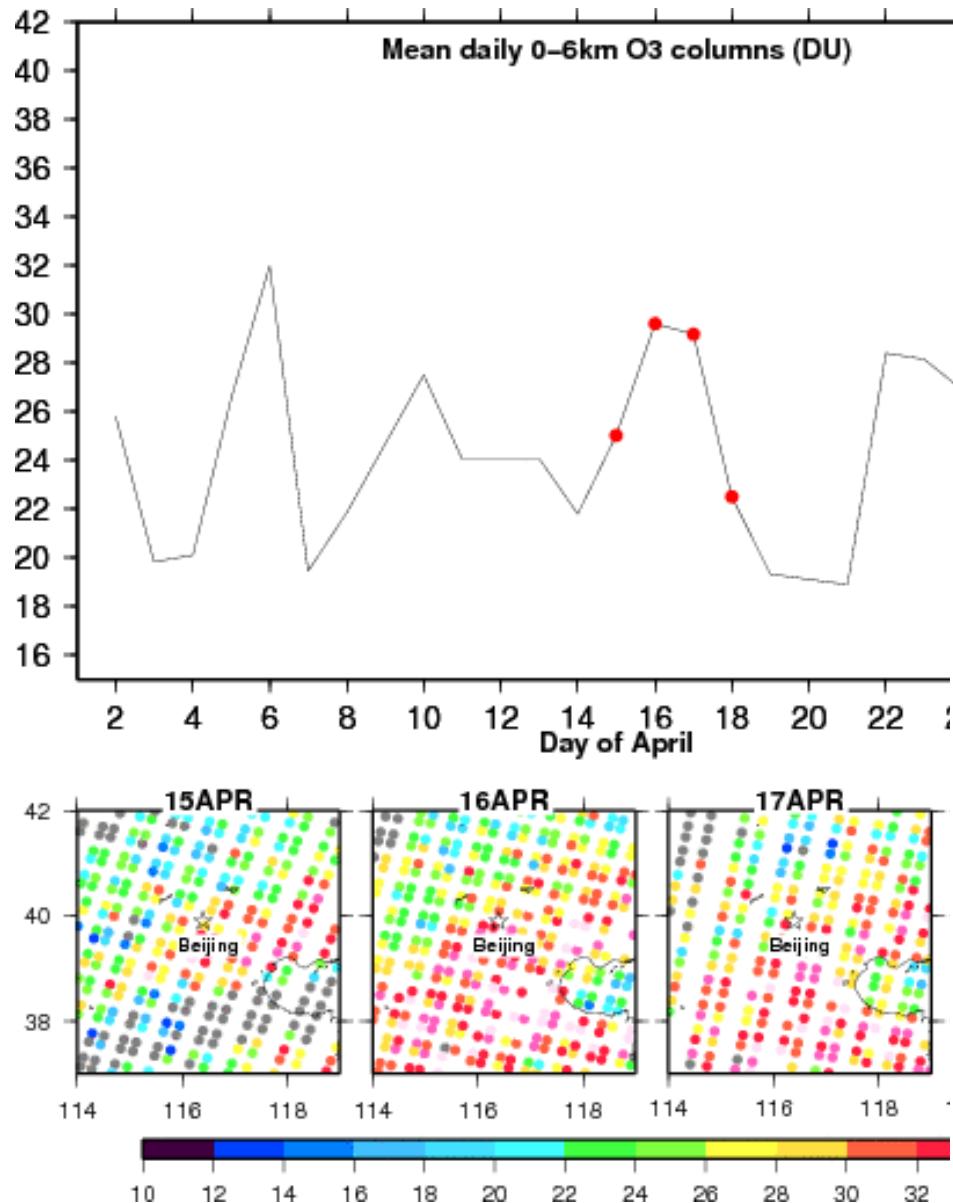

On February 10th, air masses are coming from West without changes in altitude

HYSPLIT model

Daily variations – Beijing – anthropogenic origin

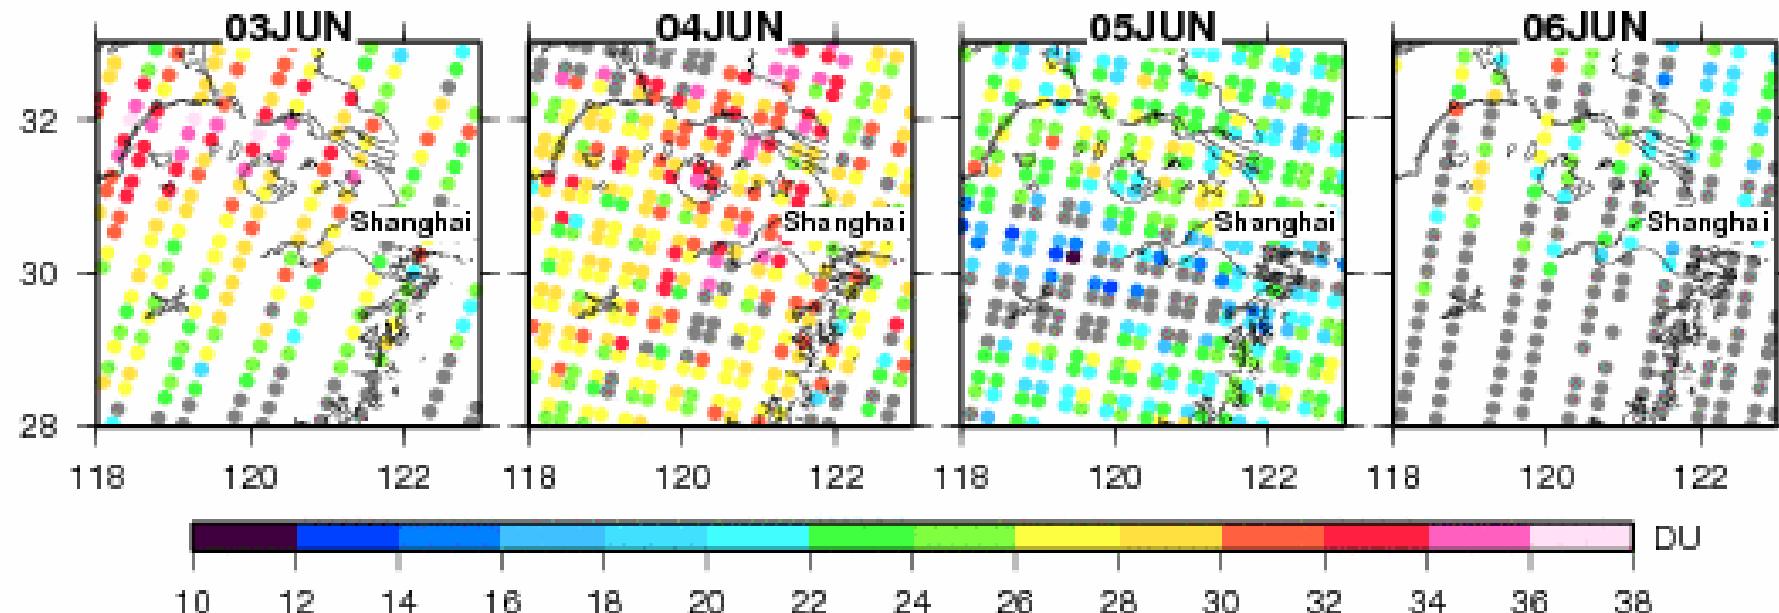

Daily variations – Beijing – anthropogenic origin

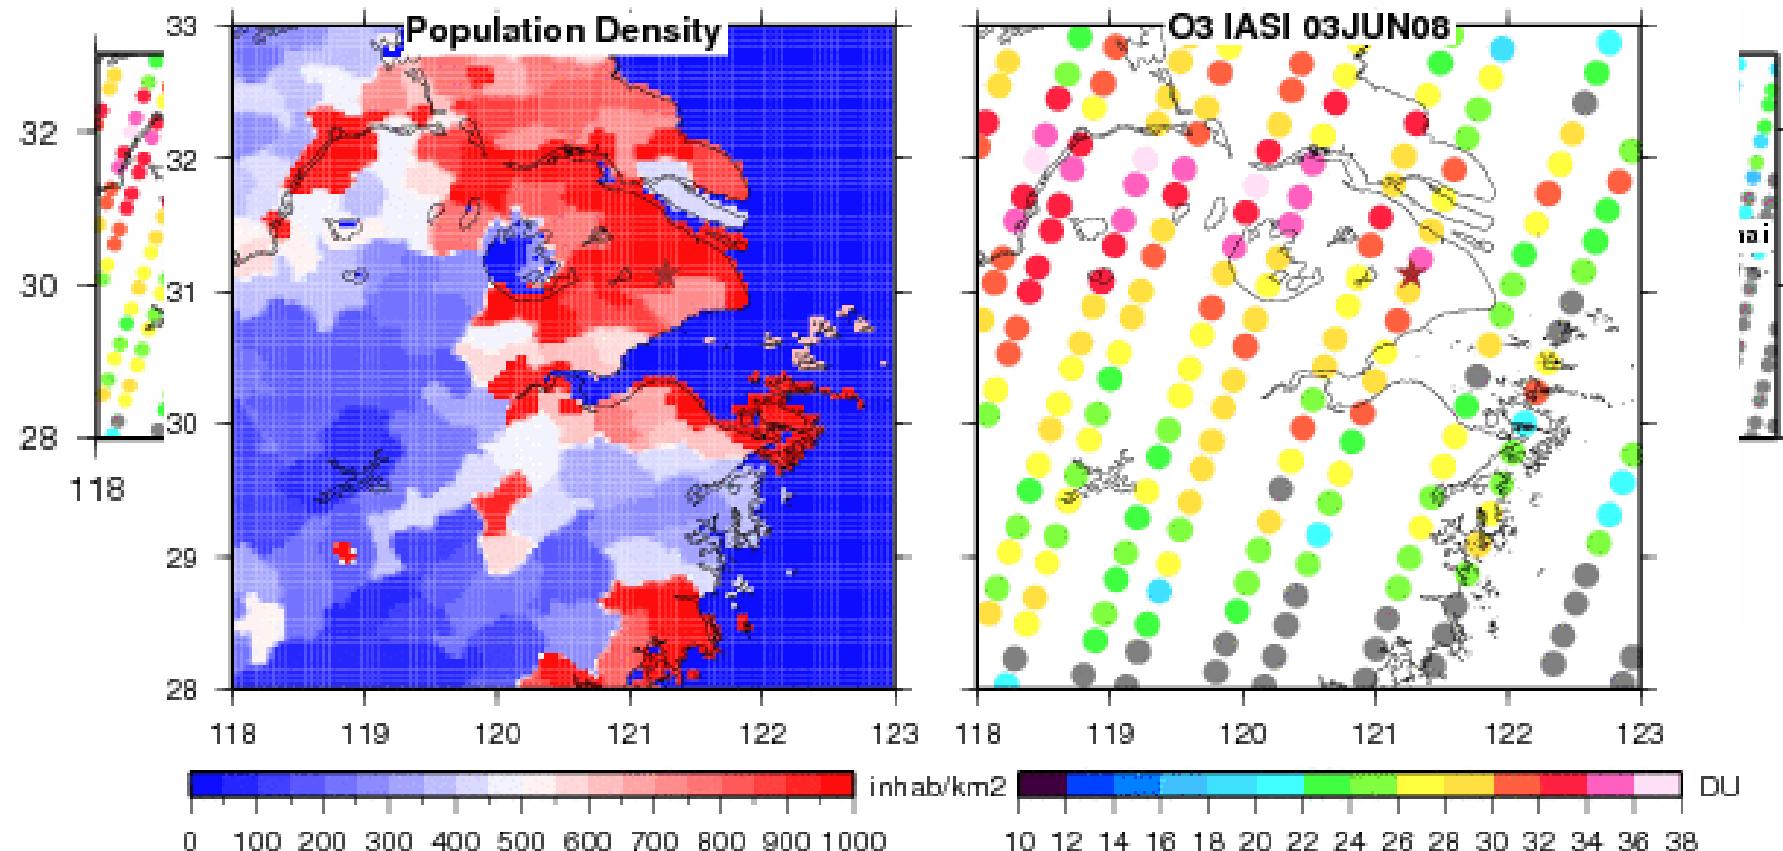

Daily variations – Shanghai – anthropogenic origin

Shanghai

Daily variations – Shanghai – anthropogenic origin

Shanghai

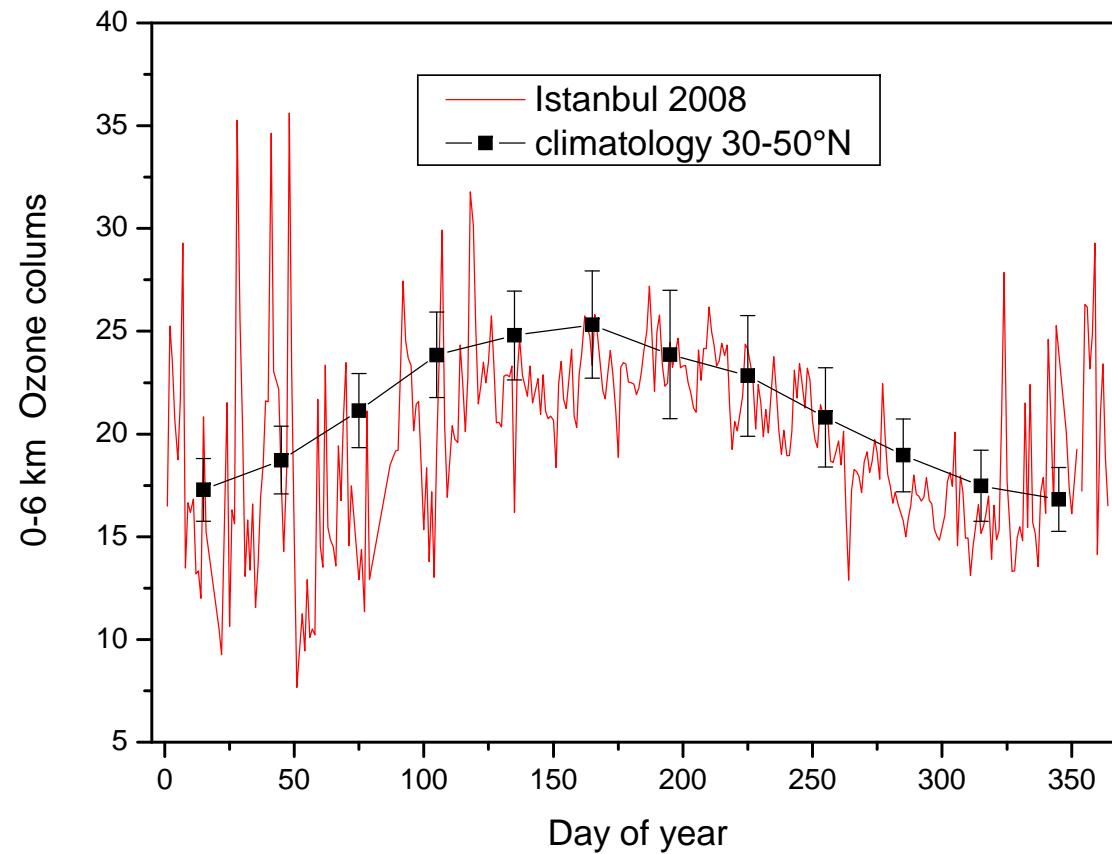

Consistency between population density and large ozone values on individual days

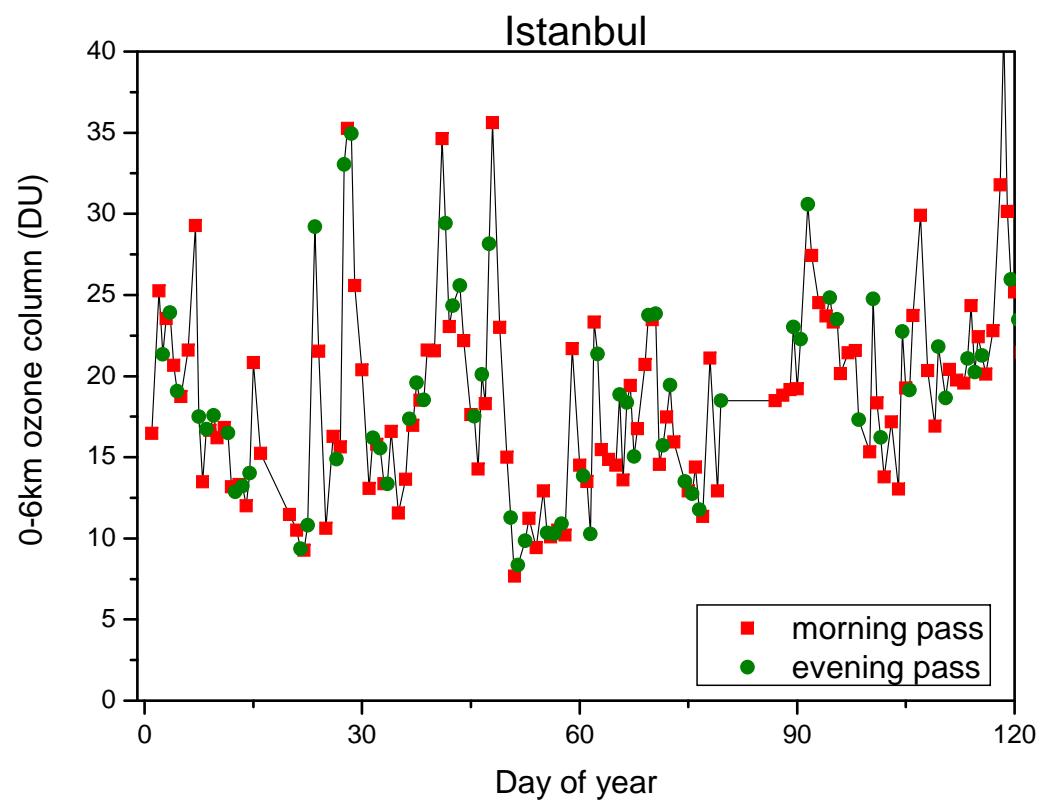

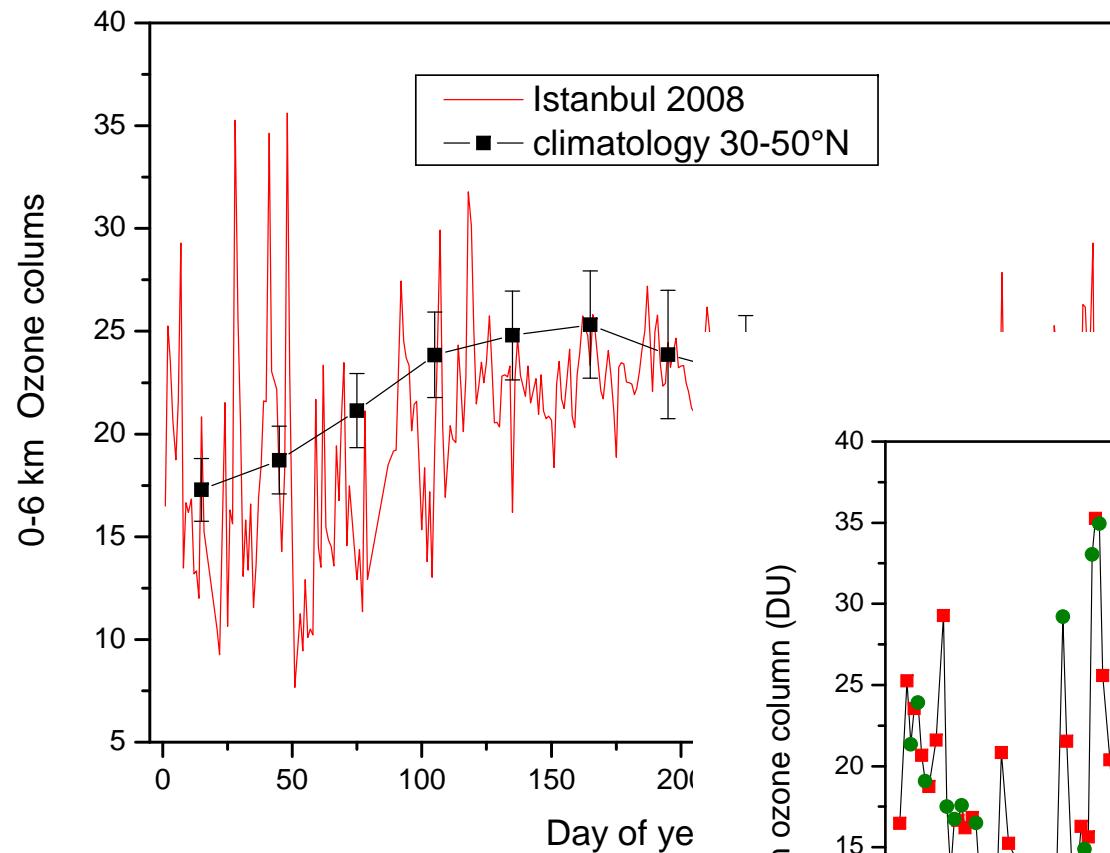

Anthropogenic origin ?

Twice daily coverage – Istanbul case

Preliminary results !

Twice daily coverage – Istanbul case

Preliminary results !

Conclusions and perspectives

- Tropospheric O₃ is retrieved from IASI with good quality
 - Validation with ozone sondes shows good agreement
 - Bias < 5% for the different tropospheric partial columns
- Ability of monitoring tropospheric ozone with IASI at the regional scale and to resolve
 - Monthly variations
 - Daily variations
- Analyses over Chinese megacities
 - Influence of the Asian summer monsoon (clean air masses during summer)
 - Large ozone observed during winter of stratospheric origin
 - Large ozone observed during spring/summer of tropospheric/anthropogenic origin
- Future work
 - Comparison with CTM
