5. LT ozone distributions
6. Conclusions

SUMMARY

1. Motivation
2. IASI and IASI-NG pseudo observations
3. Error analysis
4. Vertical sensitivity
5. LT ozone distributions
6. Conclusions

1. Motivation

- Present LEO TIR satellite instruments to monitor AQ (LT ozone):
 - up to 1.5/0.6 DOFs in the troposphere/LT (surface-6 km);
 - separate LT only at favourable conditions.
- New generation instruments envisaged (e.g., **IASI-NG**: phase A).
- We developed a **PO simulator**.
- Performance analyses to evaluate the expected added value of **IASI-NG**.

SUMMARY

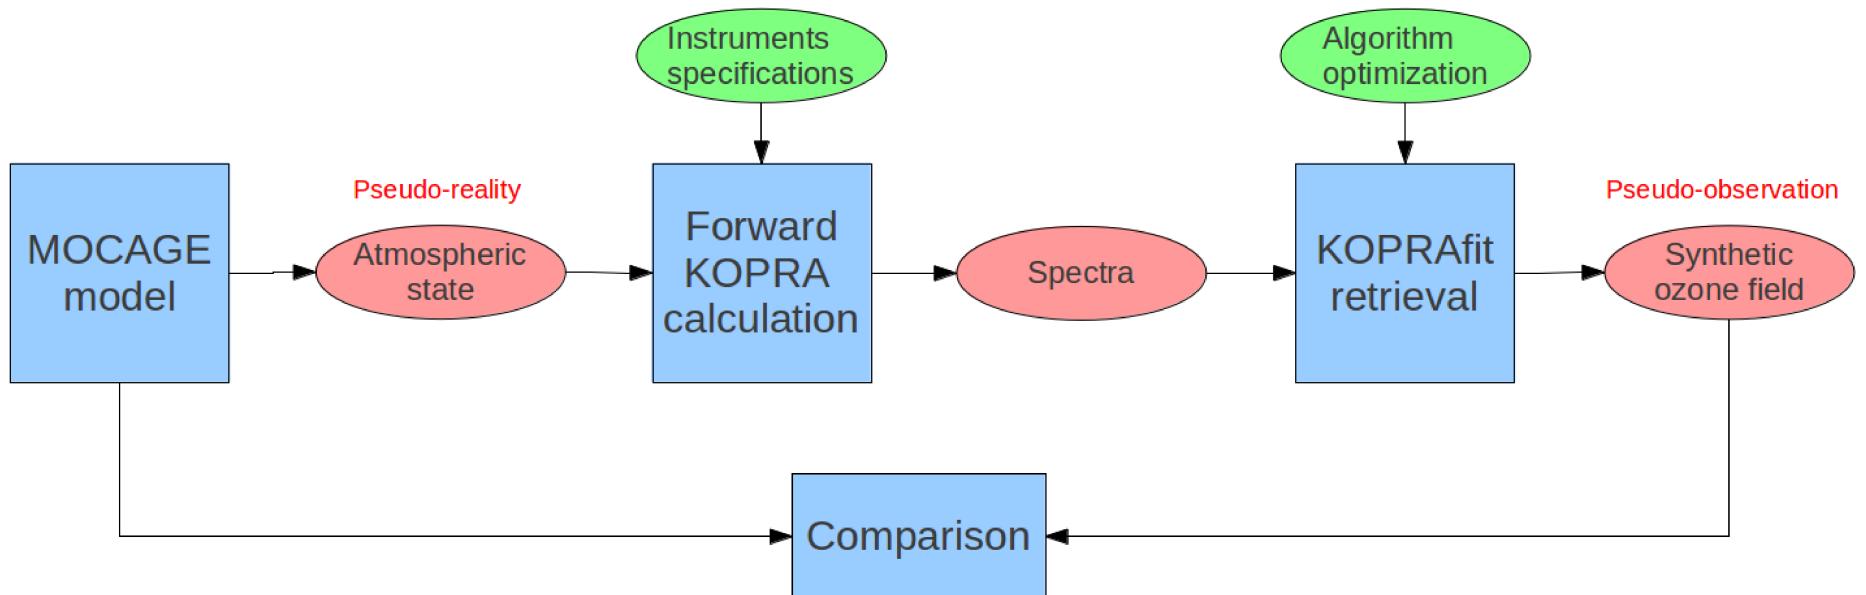

1. Motivation
2. IASI and IASI-NG pseudo observations
3. Error analysis
4. Vertical sensitivity
5. LT ozone distributions
6. Conclusions

2. IASI and IASI-NG pseudo observations (1/3) Simulator set-up

- PR: **MOCAGE** CTM
- Forward TIR RT: **KOPRA**
- Inversion algorithm: **LISA T-P(z)** embedded into **KOPRAFIT**

2. IASI and IASI-NG pseudo observations (2/3)

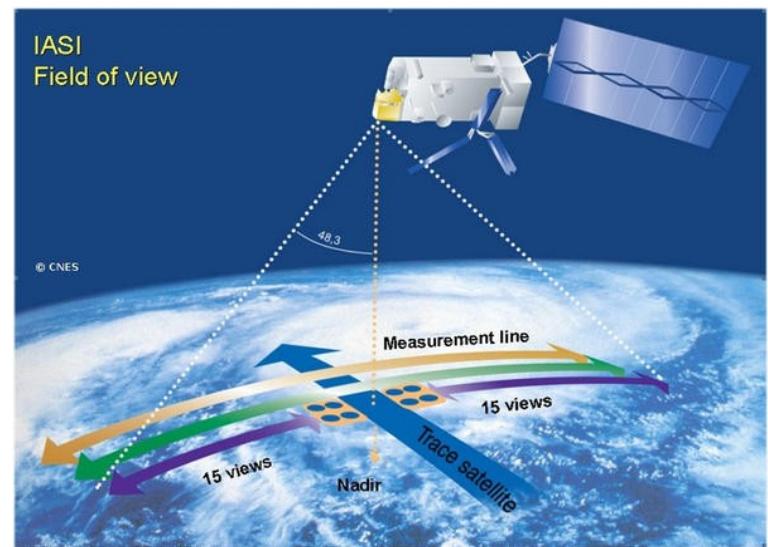

Instrumental characterisation

IASI → flying on MetOp-A/B spacecrafts

IASI-NG → phase A completed, EPS-SG
PIs: C. Clerbaux, C. Crevoisier

	IASI	IASI-NG/IRS2 (Ph.A-2020)
SSI (cm ⁻¹)	0.25	
NESR (nW/cm ² sr cm ⁻¹)	20.0	
SNR	230	2 * IASI
Rev. Time	2 Ovp/day	
Pixel Size (km)	12	

Observation geometry:
IASI/IASI-NG →
real IASI pixels

Complete RT calculation
1 month (August 2009)
AM/PM overpasses
ROI: Europe

2. IASI and IASI-NG pseudo observations (3/3) Inversion scheme

- Altitude-dependent regularization method:

- Tikhonov-Philips;
- Altitude-dependent constraints:

$$\mathbf{R} = \alpha_0(z) \mathbf{L}_0 \mathbf{L}_0^T + \alpha_1(z) \mathbf{L}_1 \mathbf{L}_1^T + \alpha_2(z) \mathbf{L}_2 \mathbf{L}_2^T$$

Constraints optimized to maximize the DOFs and minimize the error at LT

7 spectral windows in the 975–1100 cm⁻¹ spectral region

Full retrieval approach optimized for IASI real observations
(LISA algorithm)

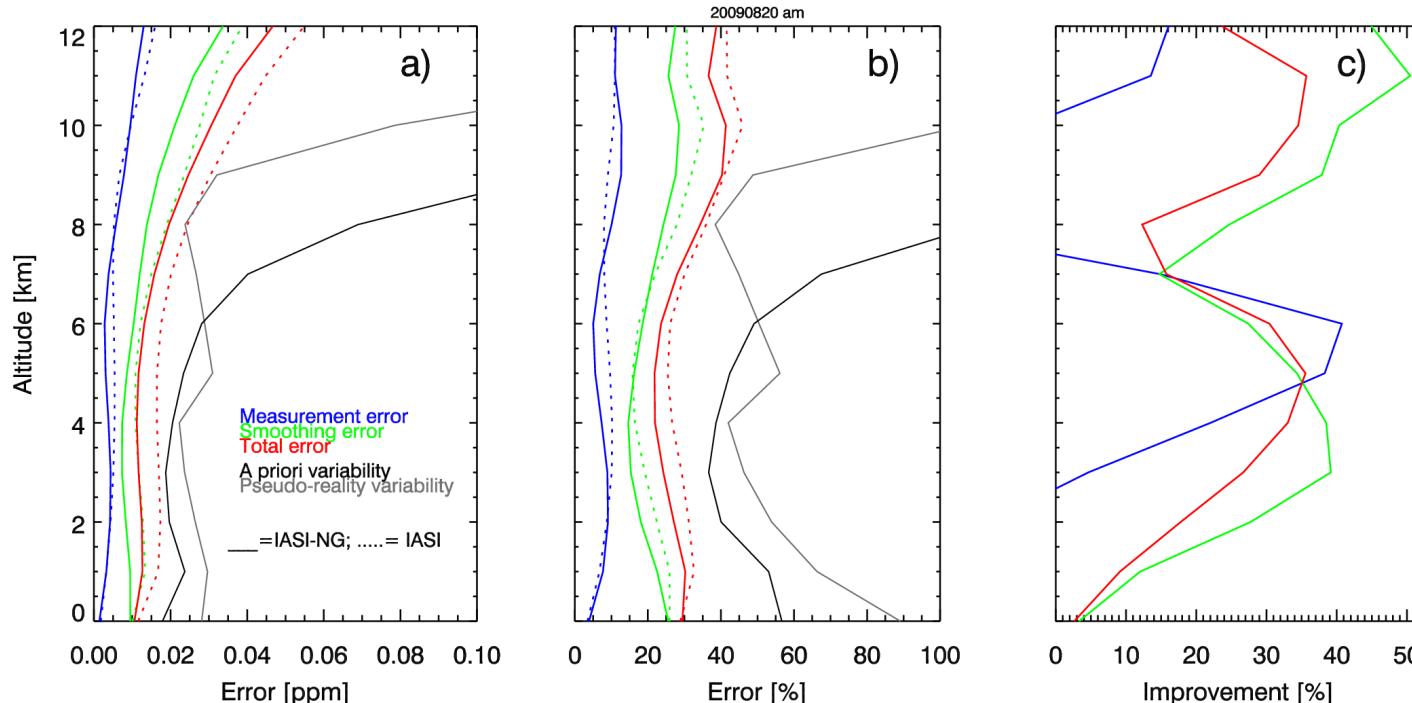

SUMMARY

1. Motivation
2. IASI and IASI-NG pseudo observations
3. Error analysis
4. Vertical sensitivity
5. LT ozone distributions
6. Conclusions

3. Error analysis

$$\mathbf{S}_e = (\mathbf{I} - \mathbf{A}) \mathbf{S}_a (\mathbf{I} - \mathbf{A})^T + \mathbf{G} \mathbf{S}_m \mathbf{G}^T + \mathbf{G} \mathbf{K}_{\text{syst}} \mathbf{S}_{\text{syst}} (\mathbf{G} \mathbf{K}_{\text{syst}})^T$$

	Surf-12 km TOC total error	Surf-6 km TOC total error
IASI	3.81 DU (10.51%)	2.49 DU (14.01%)
IASI-NG	3.12 DU (8.41%)	2.06 DU (10.71%)

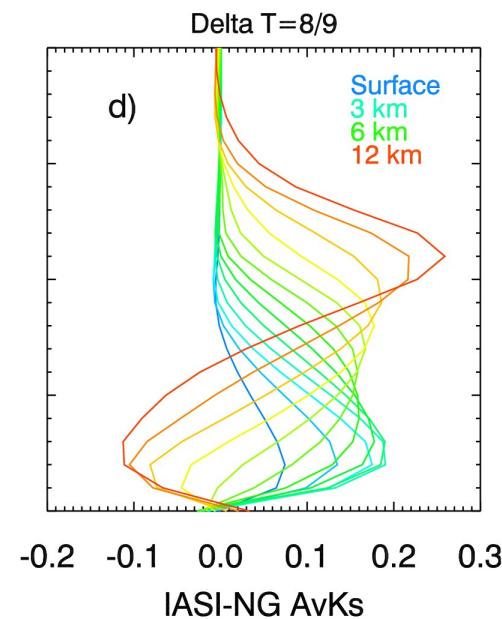

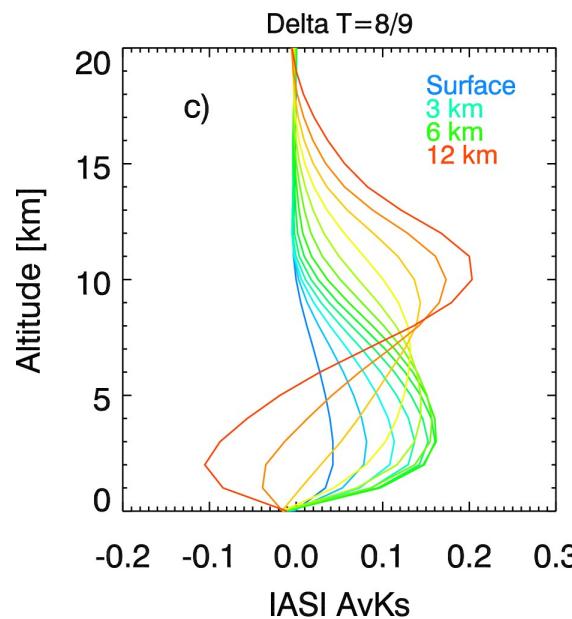

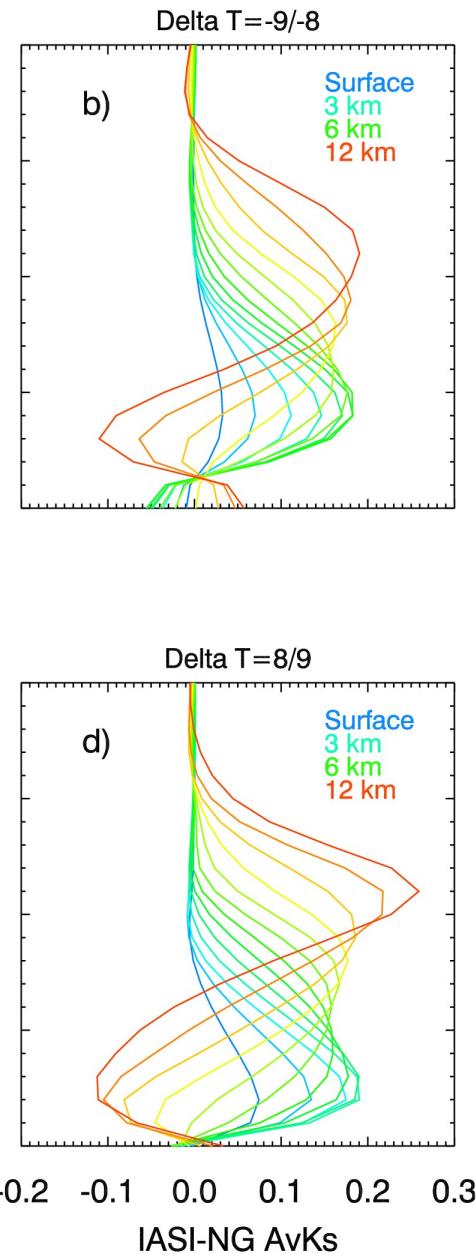

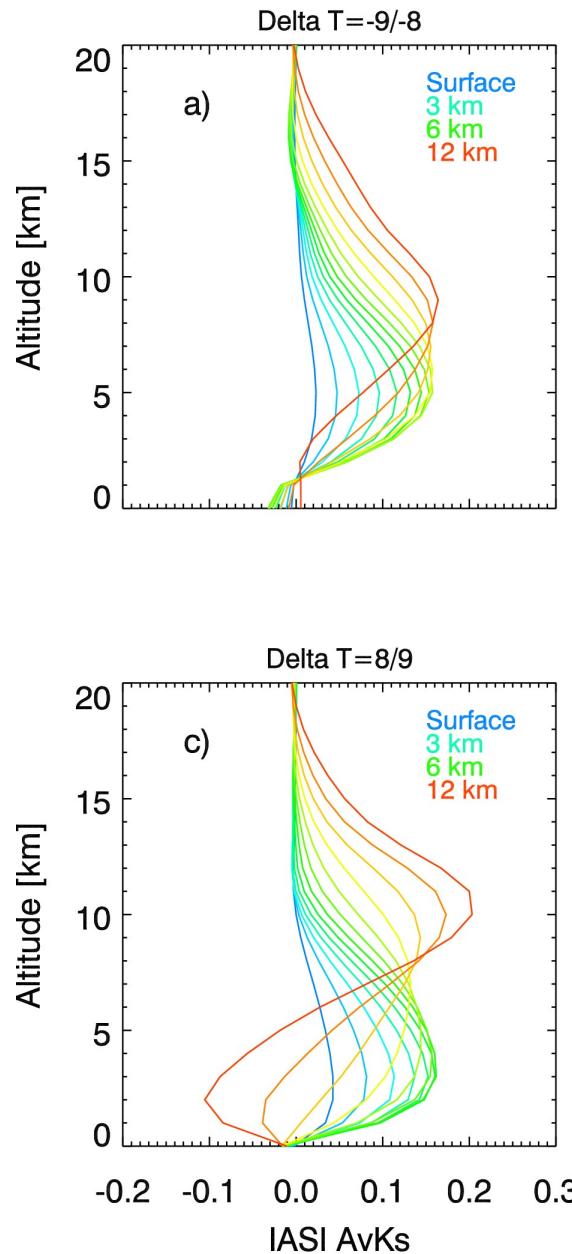

- **Smoothing error** dominant;
- **IASI-NG/IRS2** improves of up to 35% (at 5 km) on the **total error**;
- Total error on surface-6 km TOC < 20% for **IASI-NG**.

SUMMARY

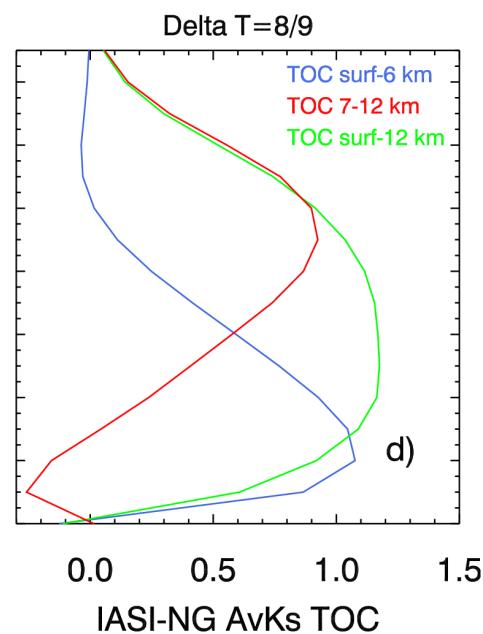

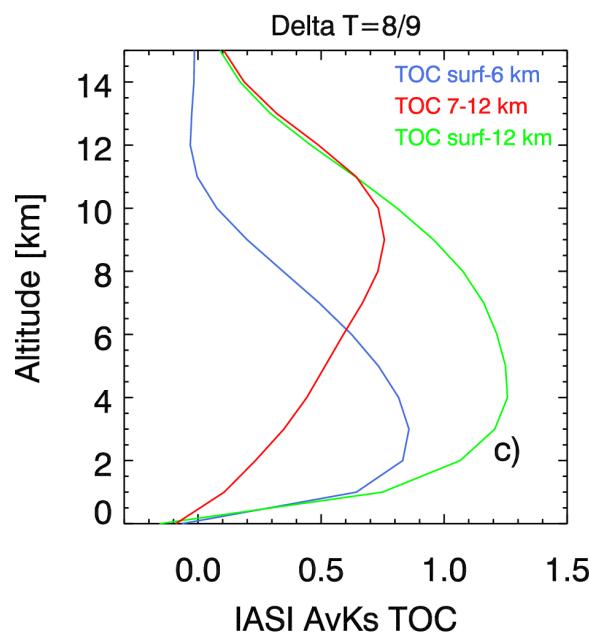

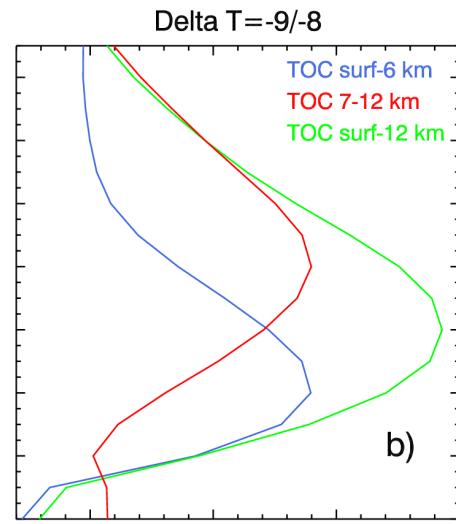

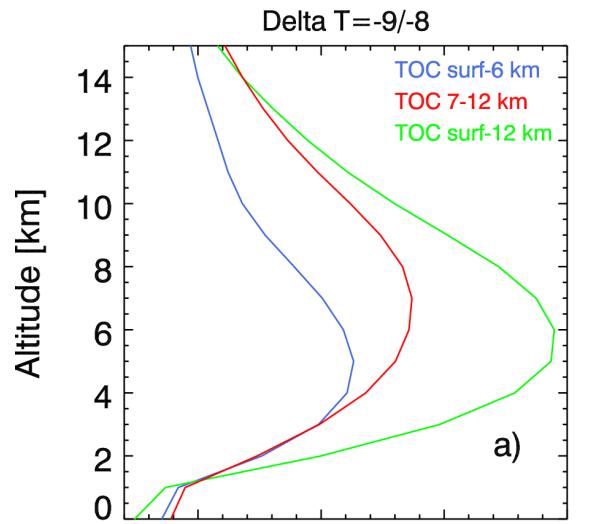

1. Motivation
2. IASI and IASI-NG pseudo observations
3. Error analysis
4. Vertical sensitivity
5. LT ozone distributions
6. Conclusions

4. Vertical sensitivity (1/3)

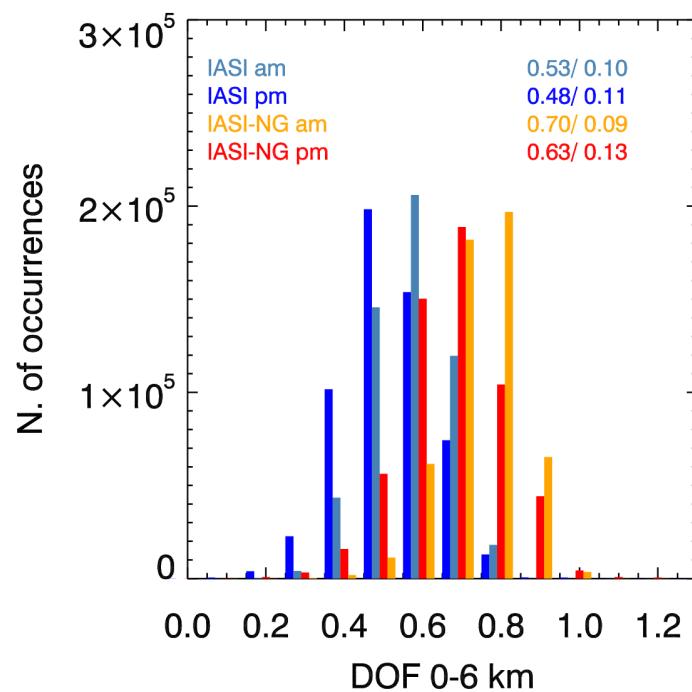

Greatest added value of IASI-NG for the low sensitivity scenarios

4. Vertical sensitivity (2/3)

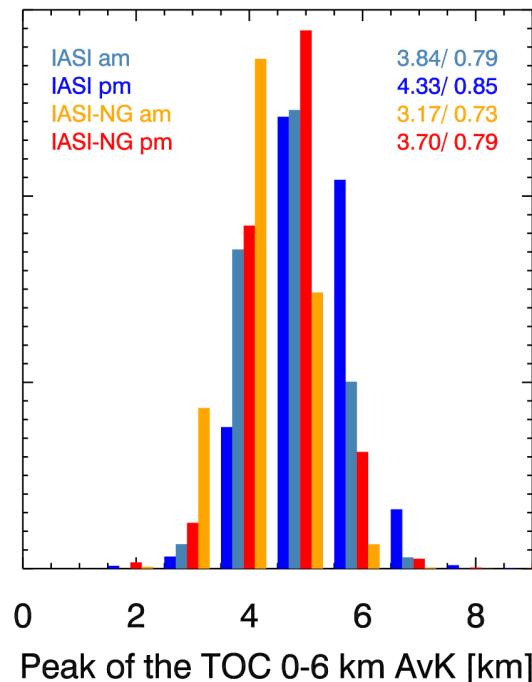

IASI-NG
is able to separate
LT from UT also at
unfavourable
conditions

4. Vertical sensitivity (3/3)

IASI
AM - 0.53 ± 0.10
PM - 0.48 ± 0.11

IASI-NG
AM - 0.70 ± 0.09
PM - 0.63 ± 0.13

IASI
AM – 3.84 ± 0.79 km
PM – 4.33 ± 0.85 km

IASI-NG
AM – 3.17 ± 0.73 km
PM – 3.70 ± 0.79 km

IASI-NG vs IASI:

- more info in the LT:
DOF surf-6 km > 30%
wrt IASI
- sensitive to lower altitudes: max sensitivity at 0.5 km lower altitudes
- sensitivity of IASI-NG at PM comparable to that of IASI at AM

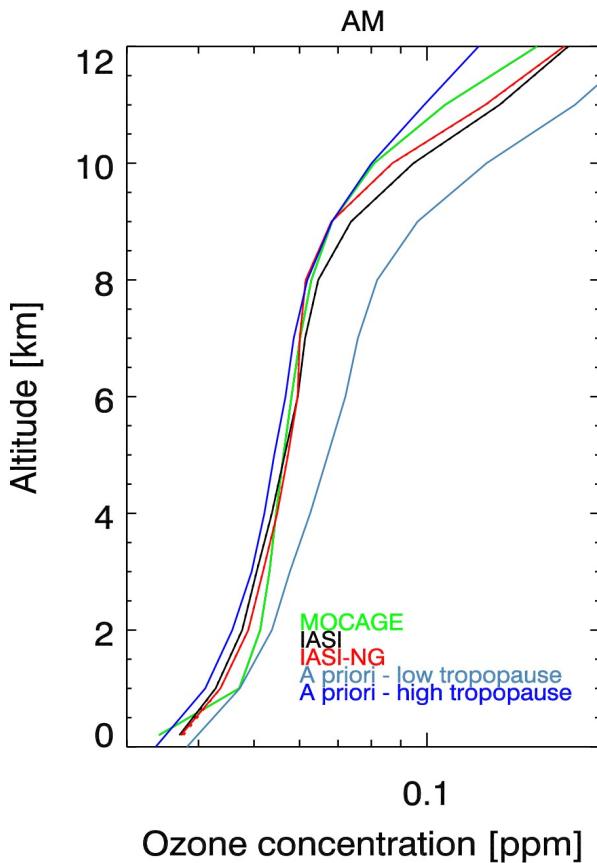

SUMMARY

1. Motivation
2. IASI and IASI-NG pseudo observations
3. Error analysis
4. Vertical sensitivity
5. LT ozone distributions
6. Conclusions

5. LT ozone distributions (1/4)

General characterization of the POs

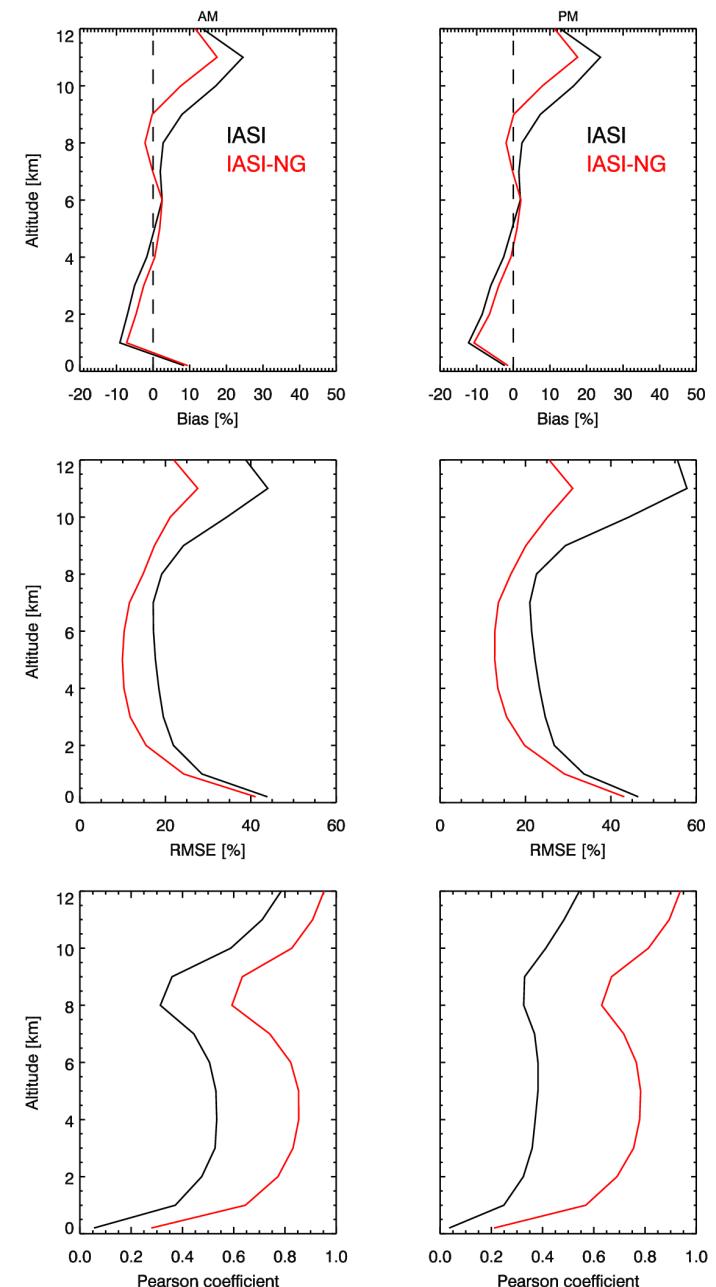

Underestimation at 1-4 km;
no significant bias at 4-8 km;
overestimation at 9-12 km.

Both biases are reduced of
over the 50% by **IASI-NG**.

Minimum RMSE at 2-8 km
(20% for **IASI** and 10% for
IASI-NG).

Pearson coefficient for **IASI-
NG** reaches 0.95 at 5 km.

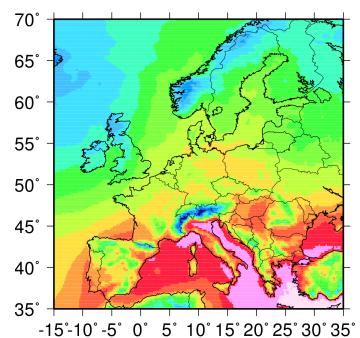

5. LT ozone distributions (2/4)

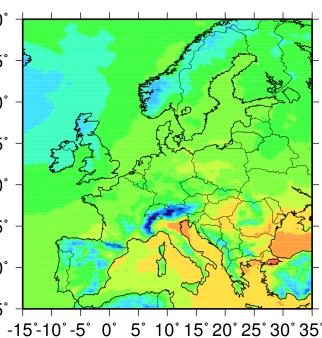

Mean distribution at continental scale

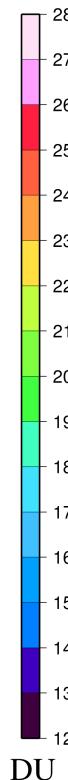

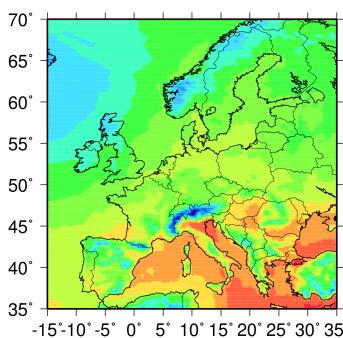

MOCAGE pseudo-reality

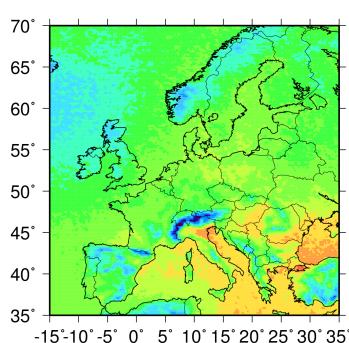

MOCAGE smoothed w IASI AvKs

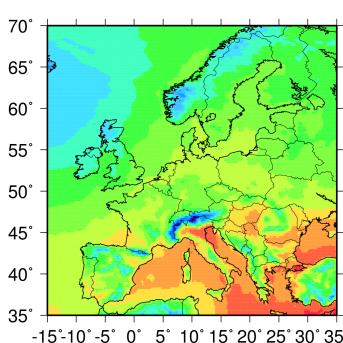

MOCAGE smoothed w IASI-NG AvKs

IASI pseudo-observations

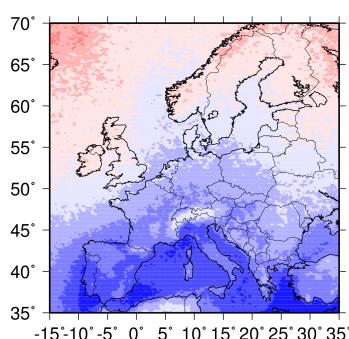

IASI-NG pseudo-observations

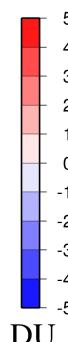

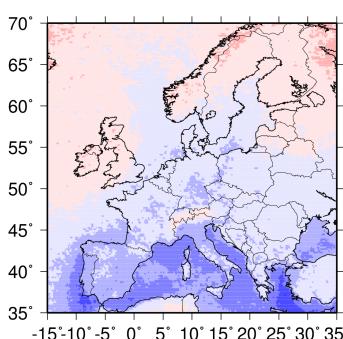

- Underestimation at Southern Europe;
- overestimation at Northern Europe.
- Areas of under/overestimation less extended for **IASI-NG**, and deviations smaller

IASI - MOCAGE raw

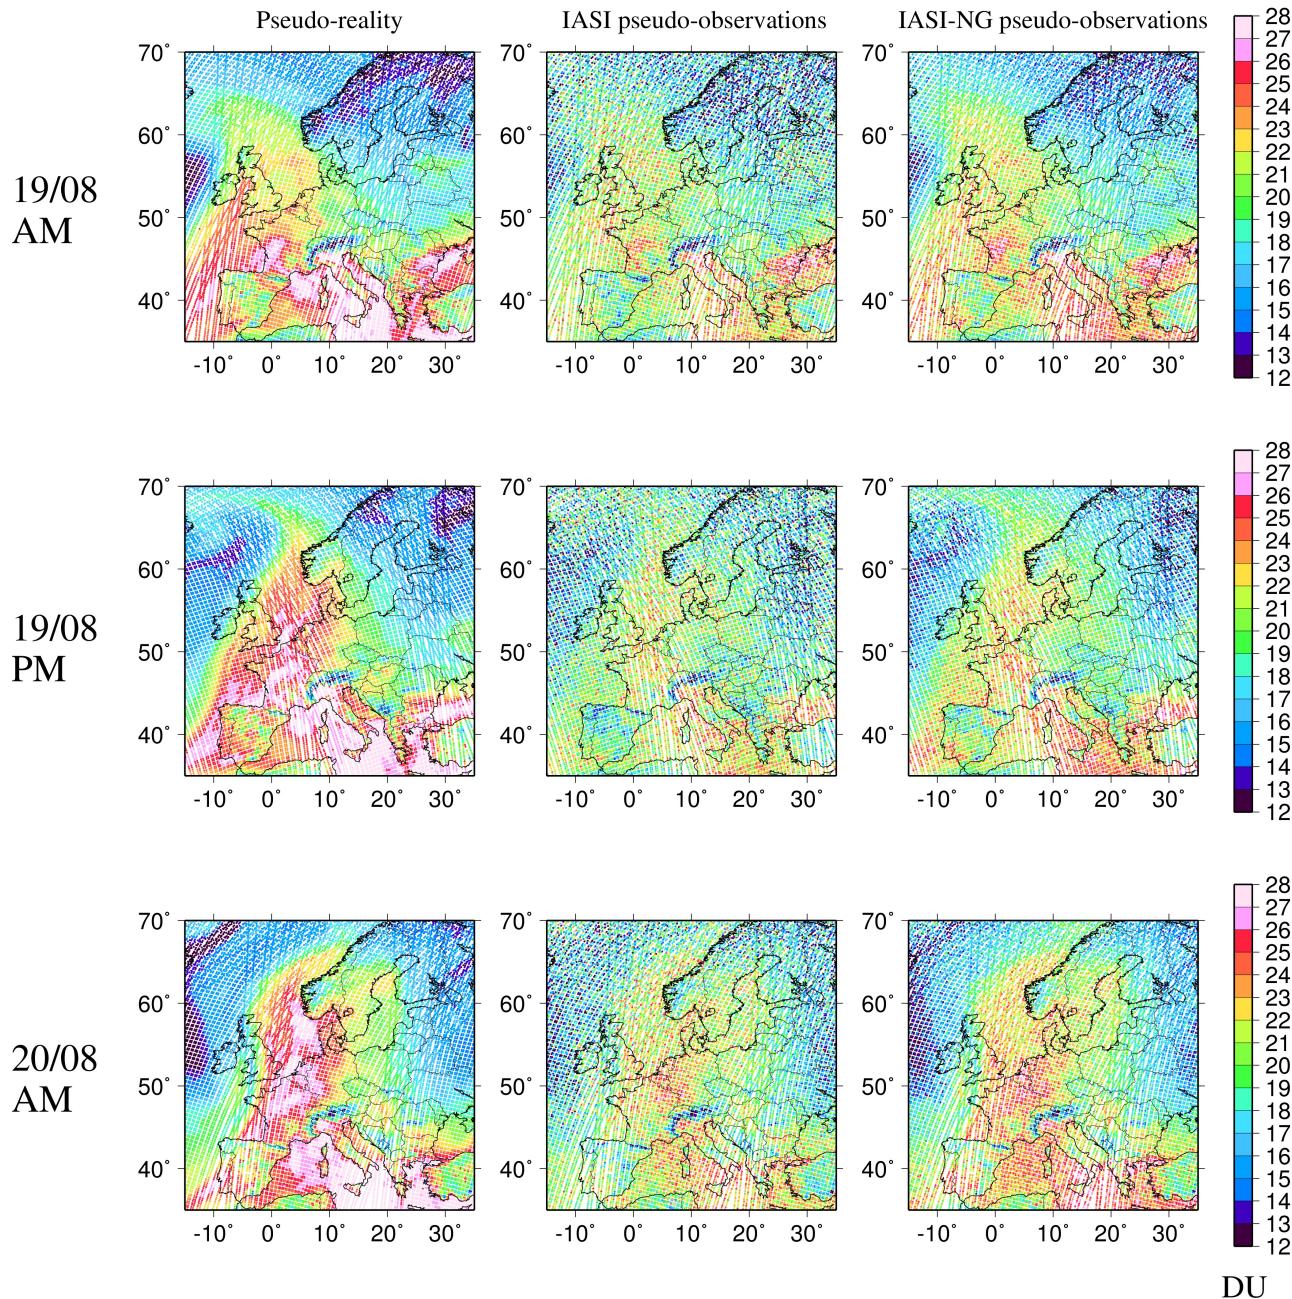

IASI-NG - MOCAGE raw

5. LT ozone distributions (3/4)

Evolution at regional scale

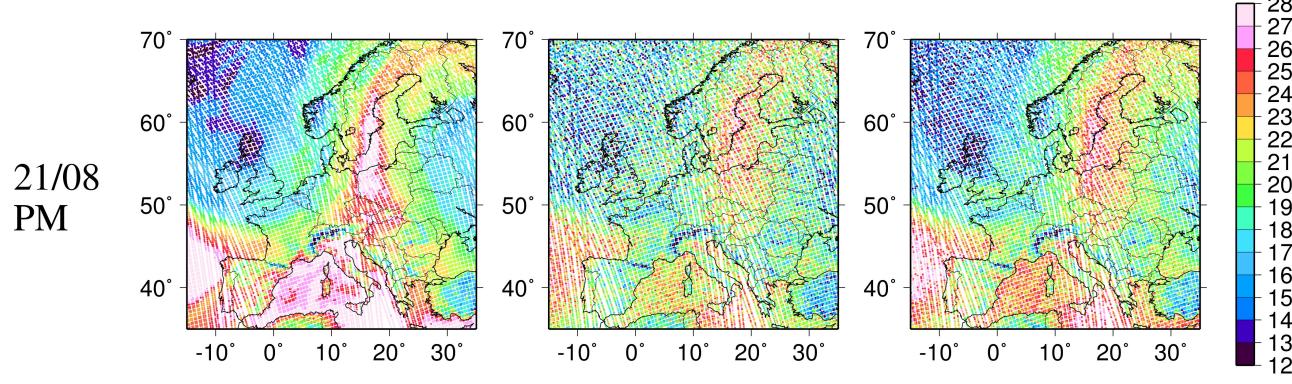

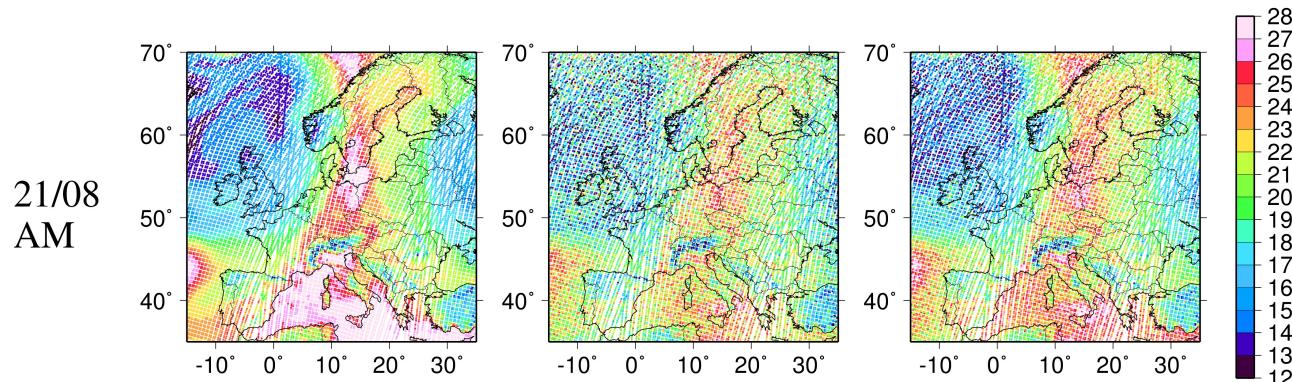

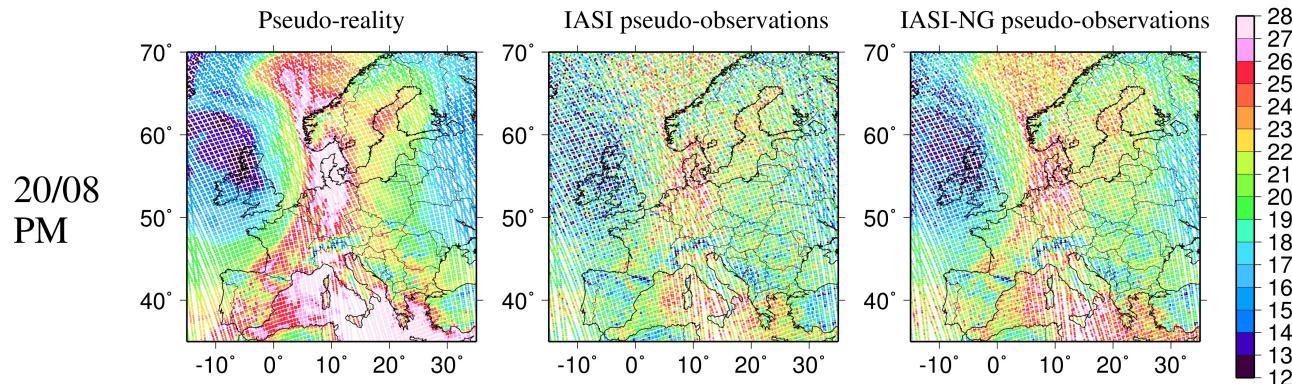

IASI-NG better suitable to follow the spatiotemporal evolution of the ozone plume 19-21/08

5. LT ozone distributions (3/4)

Evolution at regional scale

lisa

IASI-NG better suitable to follow the spatiotemporal evolution of the ozone plume 19-21/08

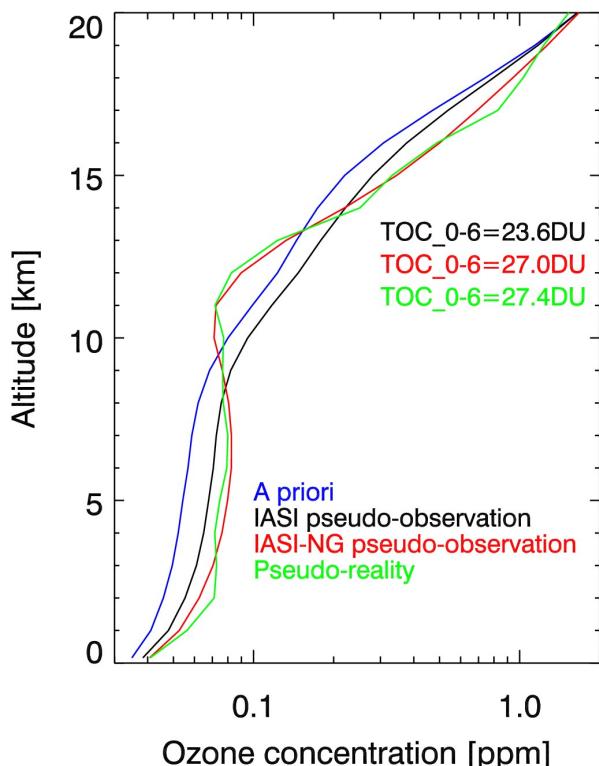

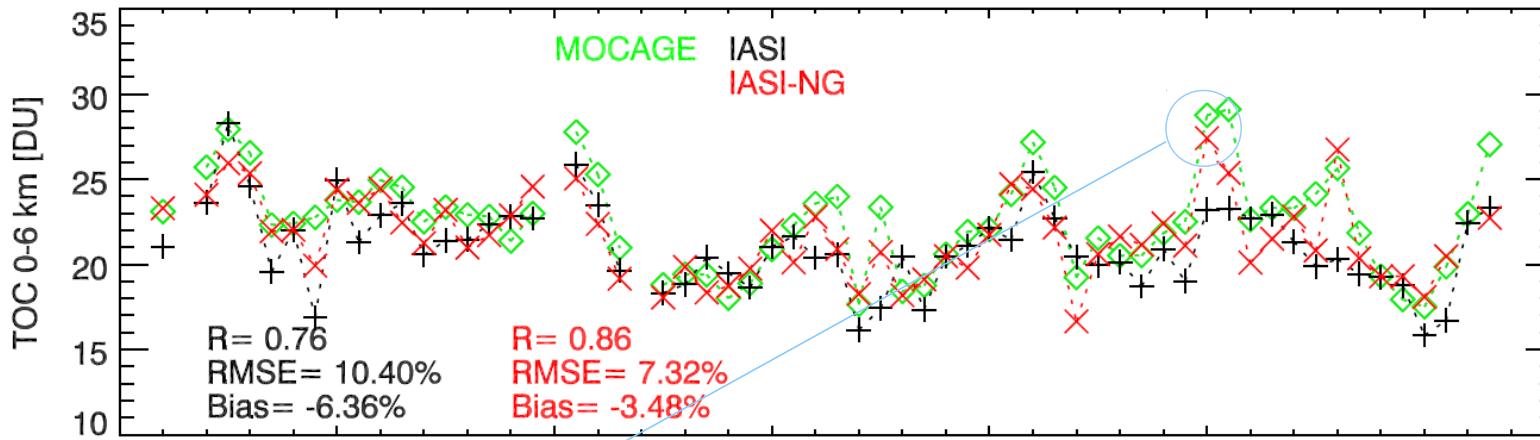

DU

5. LT ozone distributions (4/4)

Distribution at local scale

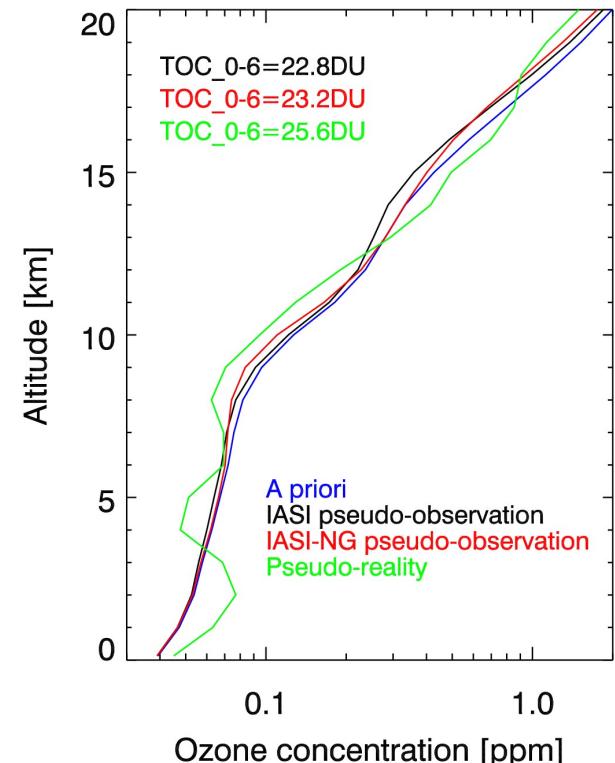

Paris

IASI-NG has better performances in the LT: better vertical resolution

The vertical resolution is still insufficient to detect features < 5km

SUMMARY

1. Motivation
2. IASI and IASI-NG pseudo observations
3. Error analysis
4. Vertical sensitivity
5. LT ozone distributions
6. Conclusions

5. CONCLUSION

- **Summary:**

- Simulation of Observing Systems starting from MOCAGE CTM pseudo-reality;
- Comparison of **IASI/IASI-NG** (IASI-NG/IRS2) tropospheric ozone retrievals;
- Specific analysis of surface-6 km TOCs;
- Spatial domain: Europe; Temporal domain: August 2009.

- **Conclusions:**

IASI-NG has (with respect to **IASI**):

- **better resolving power** of LT, also at unfavourable conditions;
- **finer vertical resolution** (5 km vs 7 km);
- **reduced biases** (both on the vertical and spatial distributions);
- **better capability to discriminate short-term evolutions** (a few days) at regional and local scale

! IASI-NG is expected to be a great step forward towards AQ monitoring !

5. CONCLUSION

- Future work:
 - Assimilation into CTM (CHIMERE) and OSSEs;

P. Sellitto, G. Dufour, M. Eremenko, J. Cuesta, P. Dauphin, G. Forêt, B. Gaubert, M. Beekmann, V.-H.Peuch, and J.-M. Flaud: Potential of the future thermal infrared space-borne sensor IASI-NG to monitor lower tropospheric ozone, Atmos. Meas. Tech. Discuss., 5, 7025-7065, doi:10.5194/amtd-5-7025-2012, 2012, under review for AMT.
